- Microphones for sound level meters were placed 5 feet above the ground for all measurements
- Sound level meters were calibrated (Larson Davis CAL 200) before and after each measurement
- Following the calibration of equipment, a windscreen was placed over the microphone
- Frequency weighting was set on "A" and slow response
- Results of the long-term noise measurements were recorded on field data sheets
- During any short-term noise measurements, any noise contaminations such as barking dogs, local traffic, lawnmowers, or aircraft fly-overs were noted
- Temperature and sky conditions were observed and documented

Noise monitoring locations were selected based on the nearest sensitive receptors relative to the proposed onsite noise sources. Three (3) short-term 15-min noise measurement was conducted at or near the Project site and are illustrated in Exhibit E of Appendix H. Appendix H includes photos, a field sheet, and measured noise data.

Traffic noise from vehicular traffic was projected using a computer program that replicates the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). The FHWA model arrives at the predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Roadway volumes correspond to the LSA Associates, Inc. segment projections in Appendix E. It's assumed that the peak hour is 10% of the ADT. The referenced traffic data was applied to the model and is in Appendix H. The following outlines the key adjustments made to the REMEL for the roadway inputs:

- Roadway classification – (e.g., freeway, major arterial, arterial, secondary, collector, etc.),
- Roadway Active Width – (distance between the center of the outermost travel lanes on each side of the roadway)
- Average Daily Traffic Volumes (ADT), Travel Speeds, Percentages of automobiles, medium trucks, and heavy trucks
- Roadway grade and angle of view
- Site Conditions (e.g., soft vs. hard)
- Percentage of total ADT which flows each hour throughout a 24-hour period

Table 3.11-8 indicates the vehicle distribution utilized for this study.

TABLE 3.11-8: TYPICAL NOISE LEVELS

MOTOR-VEHICLE TYPE	*DAYTIME % (7AM TO 7 PM)*	*EVENING % (7 PM TO 10 PM)*	*NIGHT % (10 PM TO 7 AM)*	*TOTAL % OF TRAFFIC FLOW*
Automobiles	75.5	14.0	10.5	97.42
Medium Trucks	48.9	2.2	48.9	1.84
Heavy Trucks	47.3	5.4	47.3	0.74

SOURCE: MD ACOUSTICS, 2023.

MD utilized segment projections from LSA Associates, Inc. obtained January 2023. The following outlines key adjustments to the REMEL for Project site parameter inputs:

- Vertical and horizontal distances (Sensitive receptor distance from noise source)
- Noise barrier vertical and horizontal distances (Noise barrier distance from sound source and receptor)

- Traffic noise source spectra
- Topography

The construction noise analysis utilizes the Federal Highway Administration (FHWA) Roadway Construction Noise Model (RNCM), together with several key construction parameters. Key inputs include distance to the sensitive receiver, equipment usage, % usage factor, and baseline parameters for the Project site. The Project was analyzed based on the different construction phases. Construction noise is expected to be loudest during the grading, concrete, and building phases of construction. The construction noise calculation output worksheet is located in Appendix H.

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the Project will have a significant impact related to noise if it will result in:

Would the Project:

a. Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?
b. Generate excessive groundborne vibration or groundborne noise levels?
c. For a Project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the Project area to excessive noise levels?

IMPACTS AND MITIGATION MEASURES

Impact 3.11-1: Operational Noise - The Proposed Project has the potential to generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. (Less than Significant with Mitigation)

To predict existing and cumulative noise levels due to traffic, the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference between with and without project conditions. In addition, the noise contours for 55, 60, 65, and 70 dBA CNEL were calculated. The potential off-site noise impacts caused by an increase of traffic from operation of the proposed Project on the nearby roadways were calculated for existing, existing plus Project, cumulative 2046, and cumulative 2046 plus project scenarios.

Table 3.11-9 and 3.11-10 compare the existing and existing plus project scenario. A change of 3 dB or more is required to have a perceptible difference in noise levels.

TABLE 3.11-9: EXISTING PLUS PROJECT SCENARIO - NOISE LEVELS ALONG ROADWAYS (DBA CNEL)

ROADWAY	*SEGMENT*	*EXISTING*	*EXISTING WITH PROJECT*	
		CNEL @ 50' DBA	*CNEL @ 50' DBA*	*CHANGE IN NOISE LEVEL*
Behymer Avenue	Willow Avenue to Minnewawa Avenue	60.4	60.5	0.1
Behymer Avenue	Minnewawa Avenue to Sunnyside Avenue	62.5	62.5	0.0
Behymer Avenue	Sunnyside Avenue to Fowler Avenue	62.4	62.4	0.0
Shepherd Avenue	Willow Avenue to Minnewawa Avenue	67.7	68.2	0.5
Shepherd Avenue	Minnewawa Avenue to Clovis Avenue	67.3	68.2	0.9
Shepherd Avenue	Clovis Avenue to Sunnyside Avenue	66.6	68.2	1.6
Shepherd Avenue	Sunnyside Avenue to Project Intersection (Fordham Avenue) 3	65.1	66.8	1.7
Shepherd Avenue	Project Intersection (Fordham Avenue) 3 to Fowler Avenue	65.1	65.8	0.7
Herndon Avenue	State Route 168 Eastbound Ramps to Clovis Avenue	69.4	69.6	0.2
Willow Avenue	Behymer Avenue to Shepherd Avenue	72.4	72.5	0.1
Minnewawa Avenue	Behymer Avenue to Shepherd Avenue	63.5	63.5	0.0
Clovis Avenue	Shepherd Avenue to Teague Avenue	64.1	65.3	1.2
Clovis Avenue	Teague Avenue to Nees Avenue	66.3	66.9	0.6
Clovis Avenue	Nees Avenue to Alluvial Avenue	67.9	68.4	0.5
Clovis Avenue	Alluvial Avenue to Herndon Avenue	69.9	70.2	0.3
Sunnyside Avenue	Project Intersection 1 to Shepherd Avenue	54.4	60.5	6.1
Sunnyside Avenue	Shepherd Avenue to Teague Avenue	60.3	61.6	1.3

ROADWAY	SEGMENT	EXISTING	EXISTING WITH PROJECT	
		CNEL @ 50' DBA	CNEL @ 50' DBA	CHANGE IN NOISE LEVEL
Sunnyside Avenue	Teague Avenue to Nees Avenue	60.6	61.8	1.2
Fowler Avenue	Behymer Avenue to Ticonderoga	63.4	63.5	0.1
Fowler Avenue	Ticonderoga to Shepherd Avenue	64.4	64.4	0.0
Fowler Avenue	Shepherd Avenue to Teague Avenue	65.1	65.7	0.6
Fowler Avenue	Teague Avenue to Nees Avenue	65.1	65.7	0.6
Fowler Avenue	Nees Avenue to State Route 168 Westbound Ramps	69.9	70.1	0.2

SOURCE: FHWA-RD-77-108 WITH INPUTS FROM MD ACOUSTICS. 2023.

When comparing existing plus project levels to existing levels, Sunnyside Avenue from Project Intersection 1 to Shepherd Avenue has the potential for significant impact as the only roadway segment with an increase of more than 3 dB.

NOISE IMPACTS TO ON-SITE RECEPTORS DUE TO PROJECT GENERATED TRAFFIC

The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses, but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan.

To meet the exterior residential standards of 65 dBA CNEL, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls. These walls must be at least 4.2 lbs/ft^2. Any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6- foot sound walls. The noise calculations show that along Shepherd Avenue a 6’ soundwall placed at 70 feet from the centerline would result in noise attenuation from 69.1 dBA CNEL down to a range of 62.7 to 63.1 dBA CNEL depending on the precise location along Shepherd Avenue. This range is below the 65 dBA CNEL noise standards with the 6’ soundwall.

The noise calculations also show that along Sunnyside Avenue a 6’ soundwall placed at 47 feet from the centerline would result in noise attenuation from 69.9 dBA CNEL down to a range of 63.7 dBA CNEL. This is below the 65 dBA CNEL noise standards with the 6’ soundwall.

OPERATIONAL NOISE INCREASES

The proposed Project would include typical residential noise sources which would be compatible with the adjacent existing residential uses (a.k.a. neighborhood traffic, yard equipment, truck deliveries, garbage collected, etc.). Proposed neighborhood parks are located internal to the Project site and would not impact off-site residential uses.

EXTERIOR TRAFFIC NOISE AT PROPOSED USES

The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses, but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan. Thus, this is considered a potentially significant impact.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls as required by Mitigation Measure 3.11-1. As previously discussed, the noise calculations show that along Shepherd Avenue a 6’ soundwall placed at 70 feet from the centerline would result in noise attenuation from 69.1 dBA CNEL down to a range of 62.7 to 63.1 dBA CNEL depending on the precise location along Shepherd Avenue. This range is below the 65 dBA CNEL noise standards with the 6’ soundwall.

The noise calculations also show that along Sunnyside Avenue a 6’ soundwall placed at 47 feet from the centerline would result in noise attenuation from 69.9 dBA CNEL down to a range of 63.7 dBA CNEL. This is below the 65 dBA CNEL noise standards with the 6’ soundwall.

Furthermore, as required by Mitigation Measure 3.11-2, any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6-foot sound walls. Implementation of the following mitigation measures will ensure that these potential impacts are reduced to a **less than significant** level.

INTERIOR NOISE IMPACTS AT PROPOSED RESIDENTIAL USES

Modern construction typically provides a 25-dB exterior-to-interior noise level reduction with windows closed. Therefore, sensitive receptors exposed to exterior noise of 70 dB L_{dn}, or less, will typically comply with the City of Clovis 45 dB L_{dn} interior noise level standard. Additional noise reduction measures, such as acoustically-rated windows, are generally required for exterior noise levels exceeding 70 dB L_{dn}.

As mentioned before, the Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along

Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. Based upon a 25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to be approximately 44 dB L_{dn}. Therefore, this is a **less than significant** impact.

MITIGATION MEASURE(S)

Mitigation Measure 3.11-1: *A 6-foot-tall barrier shall be constructed along the south boundary of the Project site, adjacent to Sunnyside Avenue and Shepherd Avenue, in order to achieve the City's exterior noise standards. Noise barrier walls shall be constructed of concrete panels, concrete masonry units, earthen berms, or any combination of these materials that achieve the required total height. Wood is not recommended due to eventual warping and degradation of acoustical performance. These walls must be at least 4.2 lbs/ft. These requirements shall be included in the improvements plans prior to their approval by the City's Public Utilities Department.*

Mitigation Measure 3.11-2: *The Project developer will ensure that any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6- foot sound walls.*

Impact 3.11-2: Construction Noise - The Proposed Project has the potential to generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. (Less than Significant with Mitigation)

CONSTRUCTION NOISE

During the construction of the Project, including roads, water, sewer lines, and related infrastructure, noise from construction activities would add to the noise environment in the Project vicinity. Construction noise is considered a short-term impact and would be considered significant if construction activities are taken outside the allowable times as described in the City of Clovis Municipal Code Section 5.27.604. Construction is anticipated to occur during the permissible hours according to the City's Municipal Code. Construction noise will have a temporary or periodic increase in the ambient noise level above the existing within the Project vicinity. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Noise levels will be the loudest during the grading phase. The modeling assumes construction equipment as close as 25 feet from the adjacent residences and an average of 550 feet away from the adjacent residences. Unmitigated noise levels at 550 feet have the potential to reach 60 dBA Leq and 92 dBA Lmax at the nearest sensitive receptors during grading. Noise levels for the other construction phases would be lower, approximately from 46 to 59 dBA Leq and 86 to 93 dBA Lmax. This would be a 13 dB Leq daytime increase in the ambient noise level at the residents along Perrin Rd., Purdue Ave., and East Lexington Ave.

Furthermore, noise reduction policies within the General Plan and standards within the Municipal Code are provided to further reduce construction noise. Mitigation Measure 3.11-3 embodies a preexisting legal requirement from City of Clovis Municipal Code Section 5.27.604 that ensures that construction activities are performed within specific hours. Mitigation Measure 3.11-4 provides specific requirements for attenuating noise during construction. With implementation of the Mitigation Measure 3.11-3 and 3.11-4, the potential impacts are reduced to a **less than significant** level.

Mitigation Measure 3.11-3: *Construction activities shall adhere to the requirements of the City of Clovis Municipal Code with respect to hours of operation. This requirement shall be noted in the improvements plans prior to approval by the City's Public Utilities Department.*

Mitigation Measure 3.11-4: *The contractor shall ensure that the following noise attenuating strategies are implemented during project construction:*

- *During construction, the contractor shall ensure all construction equipment is equipped with appropriate noise attenuating devices.*
- *Idling equipment shall be turned off when not in use.*
- *Equipment shall be maintained so that vehicles and their loads are secured from rattling and banging.*

Impact 3.11-3: Cumulative Noise - The Proposed Project has the potential to generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies. (Less than Significant)

To predict existing and cumulative noise levels due to traffic, the Federal Highway Administration (FHWA) Highway Traffic Noise Prediction Model (FHWA RD-77-108) was used. The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference between with and without project conditions. In addition, the noise contours for 55, 60, 65, and 70 dBA CNEL were calculated. The potential off-site noise impacts caused by an increase of traffic from operation of the proposed Project on the nearby roadways were calculated for existing, existing plus Project, cumulative 2046, and cumulative 2046 plus project scenarios.

Table 3.11-9 and 3.11-10 compare the without and with project scenario and shows the change in traffic noise levels as a result of the proposed Project. It takes a change of 3 dB or more to hear a perceptible difference

TABLE 3.11-10: 2046 SCENARIO - NOISE LEVELS ALONG ROADWAYS (DBA CNEL)

ROADWAY	SEGMENT	EXISTING	EXISTING WITH PROJECT	
		CNEL @ 50' DBA	CNEL @ 50' DBA	CHANGE IN NOISE LEVEL
Behymer Avenue	Willow Avenue to Minnewawa Avenue	66.4	66.4	0.0
Behymer Avenue	Minnewawa Avenue to Sunnyside Avenue	67.0	67.0	0.0
Behymer Avenue	Sunnyside Avenue to Fowler Avenue	63.3	63.4	0.1
Shepherd Avenue	Willow Avenue to Minnewawa Avenue	71.9	72.1	0.2
Shepherd Avenue	Minnewawa Avenue to Clovis Avenue	71.2	71.6	0.4
Shepherd Avenue	Clovis Avenue to Sunnyside Avenue	70.8	71.5	0.7
Shepherd Avenue	Sunnyside Avenue to Project Intersection (Fordham Avenue) 3	69.0	69.8	0.8
Shepherd Avenue	Project Intersection (Fordham Avenue) 3 to Fowler Avenue	69.0	69.3	0.3
Herndon Avenue	State Route 168 Eastbound Ramps to Clovis Avenue	70.5	70.6	0.1
Willow Avenue	Behymer Avenue to Shepherd Avenue	76.3	76.3	0.1
Minnewawa Avenue	Behymer Avenue to Shepherd Avenue	68.6	68.6	0.0
Clovis Avenue	Shepherd Avenue to Teague Avenue	69.9	70.2	0.3
Clovis Avenue	Teague Avenue to Nees Avenue	69.9	70.2	0.3
Clovis Avenue	Nees Avenue to Alluvial Avenue	70.9	71.1	0.3
Clovis Avenue	Alluvial Avenue to Herndon Avenue	71.8	72.1	0.2
Sunnyside Avenue	Project Intersection 1 to Shepherd Avenue	68.7	69.2	0.5
Sunnyside Avenue	Shepherd Avenue to Teague Avenue	64.1	64.7	0.6
Sunnyside Avenue	Teague Avenue to Nees Avenue	63.9	64.5	0.6
Fowler Avenue	Behymer Avenue to Ticonderoga	64.3	64.3	0.0
Fowler Avenue	Ticonderoga to Shepherd Avenue	67.9	67.9	0.0

ROADWAY	*SEGMENT*	*EXISTING*	*EXISTING WITH PROJECT*	
		CNEL @ 50' DBA	*CNEL @ 50' DBA*	*CHANGE IN NOISE LEVEL*
Fowler Avenue	Shepherd Avenue to Teague Avenue	68.4	68.7	0.3
Fowler Avenue	Teague Avenue to Nees Avenue	67.9	68.2	0.3
Fowler Avenue	Nees Avenue to State Route 168 Westbound Ramps	71.4	71.6	0.1

SOURCE: FHWA-RD-77-108 WITH INPUTS FROM MD ACOUSTICS. 2023.

As shown in Table 3.11-10, the Cumulative 2046 scenario has a maximum change in noise level of 0.7 dBA CNEL. Sunnyside Avenue from Project Intersection 1 to Shepherd Avenue has a 0.5 dBA CNEL change. Future residential uses will be in the normally compatible level along that segment. Therefore, a **less than significant** impact would occur with regard to this impact.

Impact 3.11-4: The proposed Project has the potential to generate excessive groundborne vibration or groundborne noise levels. (Less than Significant)

The construction of the proposed Project would not require the use of equipment such as pile drivers, which are known to generate substantial construction vibration levels. The primary vibration source during construction may be from a bulldozer or other earthmoving/grading equipment. According to table 3.11-3, a large bulldozer has a vibration impact of 0.089 inches per second peak particle velocity (PPV) at 25 feet which is perceptible when close to the adjacent residential properties, but is below any threshold of risk to architectural damage when compared to table 3.11-4. Therefore, a **less than significant** impact would occur within regard to this impact.

Impact 3.11-5: For a Project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Project expose people residing or working in the Project area to excessive noise levels. (No Impact)

The Project site is outside the Fresno Yosemite International Airport Contours. There are no private airstrips, public airports, or public use airports within two miles of the Project site. Therefore, this impact is not applicable to the proposed Project.

PUBLIC SERVICES AND RECREATION 3.12

This section describes and evaluates potential impacts associated with the provision of police protection, fire protection and emergency services, parks and recreation, schools, and other public facilities for the proposed Project. The information in this section is primarily derived from the:

- *City of Clovis General Plan*; and
- *Clovis Master Service Plan Update* (City of Clovis, 2014).

There were no comments received during the NOP scoping process related to this environmental topic.

3.12.1 ENVIRONMENTAL SETTING

CITY OF CLOVIS SERVICES

The City of Clovis receives funds for the provision of public services through development impact fees, property taxes, and general funds and grants. As land is developed within the City and annexed into the City of Clovis, these fees apply. The City of Clovis periodically reviews these fee structures to ensure that they provide adequate financing to cover the ongoing provision of City services, determine the correct level of adjustment required, and assure funding for needed infrastructure going forward. The City's General Services Department is responsible for continual oversight to ensure that the fee structures are adequate.[1]

Police protection to the unincorporated areas is provided by the Fresno County Sheriff and California Highway Patrol. The City has a mutual aid assistance agreement with both agencies. Continued development and annexation will affect services, but the City has proposed future facilities to accommodate growth. The operations of the Police Department, now and as the City grows, will be funded through the General Fund, Community Facilities District (CFD) fund, and grants (2014 Update).

City of Clovis Police Department

Police protection services in the City of Clovis are provided by the Clovis Police Department (CPD). The CPD operates out of its headquarters located at the Clovis Civic Center. As of 2021, the CPD has 102 sworn officers (CPD, 2021B). The department serves a community of 122,000 (CPD, 2021A). Based on this data, the service ratio is approximately 0.82 police officers per 1,000 residents.

The department classifies calls for service as Priority 1, Priority 2 or Priority 3. Priority 1 calls are calls where a threat is posed to life or a crime of violence. Priority 2 calls are calls for service where there is an urgency or suspicious behavior. Priority 3 calls are calls for service where no emergency or serious problem is involved. As of 2021, the Department reached their service rating goal of over 90 percent, with an overall approval rating of 94.7 percent (CPD, 2021A). There was an increase in all Priority level calls from 2020 to 2021, due to the COVID-19 Pandemic. The top six incident types

---

[1] It should be noted that fee laws do not allow any deficits in fees to be made up retroactively.

increased in 2021 from 2020: Assist, Check on Welfare, Alarm, Animal Complaint, Follow up, and Unwanted (CPD, 2021B).

ORGANIZATION

The Department is organized into four major divisions, which are composed of eight budgetary sections as shown below (City of Clovis, 2014).

Patrol Division

The Patrol Division is the most highly visible section of the Police Department and is overseen by a Police Captain. Uniformed Patrol, which includes traffic enforcement, a Gang Response Team, the Reserve Unit, and Community Service Officers respond to calls for service and represent the Police Department in their daily contact with the citizens of Clovis. The Patrol Division is also working with all City departments to enforce Muni-Code issues and resolve on-going issues with specific code enforcement. They also deal effectively and appropriately with the criminals they apprehend. The Police Chaplain Program assists the Department and victims of crime during traumatic events or at times of grief. The Patrol Division's aggressive and pro-active approach toward eliminating criminal activity and protecting its citizens has helped create a safe community for the citizens of Clovis (City of Clovis, 2014).

Planning and Neighborhood Services

Two Police Corporals are assigned to this division and are actively involved in reviewing new construction within the City, oversee alcohol licensing and permits, oversee massage parlors, and practitioners and run the police response to special events in the City (City of Clovis, 2014).

Communications

The Communications section provides dispatch services for the Police Department and serves as the primary answering point for 9-1-1 calls made from within the City limits. They serve as a resource to police officers, providing automated information as necessary to officers in the field (City of Clovis, 2014).

Investigations

The Investigations section is responsible for follow-up on all felony cases and preparing the cases for submittal to the District Attorney's Office. The section is divided into two main areas of responsibility: General Investigations and Narcotics. Computer Crime and Identity Theft cases are up significantly (200%) and are beginning to take a toll on other general investigators' responsibilities. Narcotics Investigators continue to work with Patrol as a team targeting street level dealers and their suppliers. Narcotics Detectives also assist in vice cases and the Gang Response Unit (City of Clovis, 2014).

Youth Services

The Youth Services unit is charged with providing services to prevent youth from drugs and alcohol abuse and prevent repeat juvenile offenders. Youth Services supports parents to manage their children and to utilize other youth services providers. The Youth Services Division is also responsible for graffiti removal throughout the City (City of Clovis, 2014).

Support Services

The Support Services unit encompasses diverse duties that focus on providing outstanding service to its customers and the citizens of Clovis. Division sections and functions include Communications/Dispatch, citizen and business services, fleet management, technology, department personnel training, department equipment and supplies management, and Records and Property (City of Clovis, 2014).

Administrative Services

The Administrative Services Division is the office of Chief of Police, which provides leadership and general direction and oversight for the entire department. The Administrative Services Division is responsible for several functions including administrative support to the Chief, special projects, research, internal audits and compliance, Homeland Security, grant administration, public information officer duties, employee injury, and oversight of workers' compensation issues. The office support staff also performs a variety of personnel functions regarding recruitment and hiring and also provides support for other division commanders (City of Clovis, 2014).

Animal Shelter

The Animal Services Division is responsible for responding to calls for service in the community, investigating cruelty to animal cases, operating the Adoption Center and stray animal facility. The Animal Services Division works closely with Clovis veterinarians to achieve the primary goal of increasing the pet adoption rate, and educating the public on the importance of reducing the pet population through spaying and neutering (City of Clovis, 2014).

TABLE 3.12-1: CLOVIS CRIME STATISTICS (2017-2019)

CATEGORY/CRIME	2017	2018	2019
Population	**108,419**	**111,759**	**114,170**
Total Violent Crimes	**243**	**221**	**243**
Homicide	0	1	0
Rape	44	46	54
Robbery	61	36	32
Assault	138	138	157
Total Property Crimes	**2,895**	**2,438**	**2,276**
Burglary	453	358	307
Larceny Theft	2,234	1,932	1,810
Motor Vehicle Theft	208	148	159
Arson	8	6	6

SOURCE: FBI CRIME STATISTICS; TABLE 8, YEARS 2017, 2018, 2019, ACCESSED HTTPS://UCR.FBI.GOV/.

As shown in the table, the majority of crimes committed in Clovis consist of property crimes, primarily larceny.

City of Clovis Fire Department

The Clovis Fire Department (CFD) is responsible for providing Fire Suppression, Technical Rescue, Hazardous Materials Spill/Release Mitigation, Emergency Medical Services (EMS), Life Safety and Enforcement Services and Emergency Preparedness for the citizens of Clovis. This responsibility includes the following functions: fire protection; emergency medical services; urban search and rescue; high angle, trench, water and confined space rescue; hazardous condition mitigation;

strategic planning; administration; fire cause and origin investigations; code enforcement; public education; emergency preparedness; disaster response and coordination. These responsibilities are distributed through two bureaus and eight divisions (City of Clovis, 2022A).

As of 2022, there are 67 well-trained and highly skilled professional firefighters, fire engineers, fire officers, chief officers, fire inspectors, and administrative staff. Together, emergency services are provided to approximately 120,124 residents with 26 square miles in the City's first due response area. In September of 2021, the CFD placed two new fire engines in-service to replace fire engines which were over 15 years old and in October, an additional three personnel were hired to fill vacancies. The CFD added a second Training Captain to the Training Division to provide support to the 13 newly hired firefighters. (CFD, 2021).

The CFD maintains response time goals for various types of calls. The CFD received a total of 12,244 calls in 2022 (CFD, 2022). Table 3.12-2 presents CFD response time goals, and actual response times from 2021. As shown in Table 3.12-2, the Department did not meet its goal times for any type of call.

TABLE 3.12-2: 90TH PERCENTILE RESPONSE GOALS AND RESPONSE TIME PERFORMANCE

RESPONSE GOAL	*GOAL RESPONSE TIME*	*ACTUAL RESPONSE TIME*
FIRST UNIT ARRIVAL, TOTAL RESPONSE TIME:		
EMS	6 Minutes, 30 seconds	7 Minutes, 35 seconds
MVA/Rescue	7 Minutes	7 Minutes, 31 seconds
Fire	7 Minutes	7 Minutes, 43 seconds
EFFECTIVE RESPONSE FORCE (DAILY STAFFING OF 19):		
Fire	10 Minutes, 30 seconds	11 Minutes, 54 seconds
TURNOUT TIME FOR ALL PRIORITY RESPONSES:	1 Minute, 30 seconds	1 Minute, 36 seconds

SOURCE: CFD 2022 ANNUAL REPORT

ISO RATING

The Insurance Services Office (ISO) Public Protection Classification Program currently rates the CFD as a 2 on a scale of 1 to 10, with 1 being the highest possible protection rating and 10 being the lowest. The ISO rating measures individual fire protection agencies against a Fire Suppression Rating Schedule, which includes such criteria as facilities and support for handling and dispatching fire alarms, first-alarm response and initial attack, and adequacy of local water supply for fire-suppression purposes. The ISO ratings are used to establish fire insurance premiums (City of Clovis, 2022A).

FIRE STATIONS

There are currently six stations in operational use: Stations 1 through 6. In July 2021, hiring took place which made it possible to add the sixth fire company in service. Station 6 serves nearly 25,000 residents in the neighborhoods east of Temperance Avenue and south of Bullard Avenue; the new station opened in September 2022.[2] The new station is strategically located to meet the needs of the growing Loma Vista Community. The CFD fire stations and locations are each listed below.

- Station 1 – 633 Pollasky Avenue (operational)
- Station 2 – 2300 Minnewawa Avenue (operational)
- Station 3 – 555 North Villa Avenue (operational)
- Station 4 – 2427 Armstrong Avenue (operational)
- Station 5 – 790 North Temperance Avenue (operational)
- Station 6 – 2388 Encino Avenue (operational) In addition, the CFD operates out of the Training Center, located at 3455 Lind Avenue, as well. (City of Clovis, 2022B).

City of Clovis Parks and Recreation Division

The General Services Department provides a range of services for residents and visitors, such as, Senior Services, Transit, and Clovis Recreation programs (City of Clovis, 2022C). The Parks Division falls under the direction of the Public Utilities Department and is overseen by a full time Parks Manager with a staff of approximately 20 employees. The goal of the Division is to maintain recreational facilities, streetscape, parks, trails, and other landscaped open space areas, City trees, and building grounds. (City of Clovis, 2018). The City of Clovis Recreation Section is responsible for operating the City of Clovis Batting Cages, Clovis Rotary Skatepark, Adult slow-pitch softball at Clovis Rotary Park, and the youth and adult programs at the Clovis Recreation Center (City of Clovis, 2022D).

The City of Clovis currently owns and maintains 81 parks, two of which are jointly maintained by a homeowners association (HOA) (i.e. Harlan Ranch,TR6200)). These parks range from passive (Dry Creek Trailhead and Cottonwood) to active (Rotary and Sierra Bicentennial), and are a mix of smaller pocket parks to larger basin parks. All parks are classified as either Pocket Park, Neighborhood Park, Area Park, Community Park, Regional Park, School Park, or Basin Park based on the parks standards outlined by the City. In addition to these facilities, Clovis maintains over 28.1 miles of trails. These trails are comprised of four primary trails (Clovis Old Town Trail, Dry Creek Trail, Enterprise Trail, and PG&E Trail) as well as a series of greenbelt paths in the northeast corner of the City and Paseos in the southeast (City of Clovis, 2018).

The Parks Division maintains approximately 452 total acres of City parks and landscaping; 81 parks totaling 173 acres; 263 acres of green belts, street gardens, trails, paseos, and landscaped median islands; 6 acres of building grounds; 12 acres of undeveloped park land and miscellaneous public right-of-way property; approximately 40,000 City street trees; and 28.1 existing miles of trails with 36 miles planned for the future (City of Clovis, 2018).

The Clovis General Plan establishes a goal of four acres of parkland per 1,000 residents, which exceeds the requirement set forth by the Quimby Act. Based on the 2017 population of 110,762

---

[2] See: https://www.clovisroundup.com/clovis-fire-station-6-opens-for-added-public-safety/

residents and the park goals laid out by the General Plan, the City is working successfully toward meeting the park area goals. Currently, the City has 81 designated City parks that total approximately 173 acres. The goal for future planning increases the park area to approximately 380 acres and also substantially increases the number of trails (City of Clovis, 2018).

Types of Parks

POCKET PARKS

Pocket Parks are the smallest park classification at up to one acre in size. These parks are centrally located in residential neighborhoods and planned for families and children. Intended to offer a small open space/recreational venue of a more passive or intimate nature internal to a specified residential development. Typically, these parks provide picnic and sitting areas and should be accessible by foot or bicycle. Currently, the City has 1.58 acres of Pocket Parks made up of eight locations (City of Clovis, 2018).

NEIGHBORHOOD PARKS

Typically, a neighborhood park ranges from one to two acres in size. These parks are uniquely tailored to the neighborhoods they serve and provide active recreation and a balance of amenities that appeal to a broad range of individuals. Currently, the City has 44.38 acres of Neighborhood Parks comprised of 50 parks. Three of these are HOA maintained (City of Clovis, 2018).

AREA PARKS

Area Parks function much like Neighborhood Parks, but are typically larger, ranging from 3 to 20 acres, and serve a larger population. These are intended to provide amenities for multiple age groups and connect to neighborhoods via trails or sidewalks. Currently, the City has 11 Neighborhood Parks totaling 41.99 acres (City of Clovis, 2018).

COMMUNITY PARKS

Community Parks are considerably larger in scale, ranging from 15 to 100 acres. The intent of these parks is to meet a wide range of community recreation and social needs focused on both passive and active recreation. The purpose of a community park is to bring people together to recreate, socialize, and find quiet space. Amenities may include those similar to a Neighborhood Park, as well as group picnic facilities, internal trails, and athletic facilities. Currently, the City has five Community Parks totaling 67.51 acres (City of Clovis, 2018).

REGIONAL PARKS

Regional Parks typically service multiple cities, cross political jurisdictions, and exceed 100 acres in size. The purpose of the parks is to preserve natural resources, remnant landscapes, and open space. These parks can include passive activities, such as hiking and nature viewing, as well as active recreation areas, gardens, picnic facilities, and other special uses. There are currently no existing Regional Parks in the City of Clovis (City of Clovis, 2018).

- **Woodward Park** is three miles west of the City’s western limits. This regional park is approximately 300 acres and includes amenities such as a multi-use amphitheater, a

Japanese garden, **[3]fenced dog park, exercise par course, playgrounds, a lake, picnic areas, mountain bike courses, and miles of multipurpose trails that are part of the San Joaquin River Parkway's Lewis S. Eaton Trail. There are six shelters located throughout the park.

- **Millerton Lake State Recreation Area** is 6.6 miles north of the SOI beyond the non-SOI Plan Area boundary. It spans over 6,800 acres of land; Millerton Lake (Reservoir) spans an additional 4,900 acres when full. The land portion of the recreation area is operated by the California Department of Parks and Recreation. Millerton Lake is managed by the U.S. Bureau of Reclamation. Recreational facilities include boat launch ramps, picnic areas, hiking trails, mountain biking trails, campgrounds, and boating campsites.
- **Lost Lake Recreation Area** is a Fresno County facility on the San Joaquin River. It is 4.5 miles north of the SOI and includes a 38-acre lake, campground, picnic area, softball field, volleyball courts, hiking trail, nature study area, playgrounds, and restrooms.

BASIN PARK

This classification pertains to Fresno Metropolitan Flood Control basins used in concert with, or in lieu of, other classes of parks to meet open space needs. These sites typically range from five to 20 acres and their uses are generally limited to dry periods due to their main priority as flood control facilities. Basin Parks offer connections to the larger community via trails or sidewalks. There are currently three Basin Parks totaling 21.13 acres (City of Clovis, 2018).

SCHOOL PARK

The School Park classification pertains to school sites used in concert with, or in lieu-of, other classes of parks to meet open space needs. The City maintains an "open gate" policy for Clovis Unified School District (CUSD) land and facilities available for recreational use after normal school hours and during the summer. These sites are best suited for community-based recreational programs and youth athletic facilities. Currently there are approximately 271 acres of CUSD Sites available for shared use.

The inventory of parks for the City of Clovis lists existing facilities found in every park. The parks are organized according to their classification type. Typical facilities within the Clovis Parks include, but are not limited to, playgrounds, benches, grill stations/BBQs, open lawns, and generous tree canopies. The data for the asset inventory was collected by Land Design and Green play, and this information was supplemented with GIS data from the City and additional site inventory visits (City of Clovis, 2018).

City Parks

City contains approximately 81 parks totaling 173 acres; 263 acres of green belts, street gardens, trails, paseos, and landscaped median islands; 6 acres of building grounds; 12 acres of undeveloped park land and miscellaneous public right-of-way property; approximately 40,000 City-street trees;

---

and 28.1 existing miles of trails with 36 miles planned for the future. The Clovis General Plan establishes a goal of four acres of parkland per 1,000 residents. Table 3.12-3 summarizes the City's park facilities by category. Table 3.12-2 utilizes the 2022 population of the City, 123,665, to determine the current acreage ratio (DOF, 2022).

TABLE 3.12-3: SUMMARY OF PARKS AND RECREATION FACILITIES

PARK TYPE	*NUMBER*	*ACREAGE*	*CURRENT RATIO (ACRES PER 1,000 RESIDENTS)*
Pocket Parks	8 locations	1.58	0.013
Neighborhood Parks	50 parks	44.38	0.36
Area Parks	11 parks	41.99	0.34
Community Parks	5 parks	67.51	0.55
Regional Parks	3 sites*	~1,238	10.01
Basin Parks	3 parks	21.13	0.17
School Parks	--	271	2.19
TOTAL	**--**	**1,685.6**	**--**

SOURCE: CLOVIS PARKS MASTER PLAN, 2018

**SITES ARE NOT WITHIN CITY BORDER OR SOI BUT SERVICE CLOVIS POPULATIONS*

When the acreage is broken down into functional categories, it displays that the City currently does not meet park acreage standards for any category. While Regional Parks acreage surpasses the City's goal of four acres per 1,000 residents, no Regional Parks are within the City of Clovis; Regional Parks typically service multiple cities across political jurisdictions (City of Clovis, 2018). Further, the City has a long-standing joint use agreement with CUSD for use of school district recreational facilities by the public. Due to limited access, these facilities are calculated at half their acreage and facility quantities in the Level of Service (LOS) analysis.[4] Thus, of the 271 acres of CUSD school playfields, approximately 135 acres are credited toward meeting the City's parkland standard. (City of Clovis, 2018).

The City's Parks Master Plan identifies additional facility needs required over the next five to ten years. The goal for future planning increases the park area to approximately 380 acres and also substantially increases the number of trails. This amount is approximate and could be met by a combination of utilizing existing undeveloped parkland and acquiring new parkland to develop (City of Clovis, 2018).

Typical facilities within the Clovis Parks include, but are not limited to, playgrounds, benches, grill stations/BBQs, open lawns, and generous tree canopies (City of Clovis, 2018).

---

[4] Level of Service (LOS) standards and analysis is a commonly-used method to examine how well a community's park and recreation needs are being met through a comparison to standards of national, state, and comparable municipality; population size is an important factor for assessing park and recreational needs.

OTHER AGENCY SERVICES

Clovis Unified School District

The City of Clovis and its sphere of influence lies primarily within the CUSD. Only a small portion of the southwest area of the City lies in the Fresno Unified Scholl District (FUSD). A small portion of the southeast area of the proposed sphere of influence lies within the Sanger Unified School District (SUSD). These districts are affected by residential growth in the Clovis area. CUSD is managing the growth by financing new facilities through bonds, development fees, and state schools funding (City of Clovis, 2014).

The CUSD provides school services for grades TK through 12 throughout most of Clovis, 20 percent of Fresno and a small portion of unincorporated Fresno County. The CUSD is approximately 200 square miles and serves more than 42,000 students at 44 comprehensive schools. (CUSD, 2022A). Table 3.12-4 provides the CUSD school inventory for K-6 grade schools, 7-8 grade schools, and 9-12 grade schools. Table 3.12-4 does not include the CUSD's education service schools or programs.

SOURCE: CALIFORNIA DEPARTMENT OF EDUCATION 2021-22ENROLLMENT BY GRADE

As shown in Table 3.12-4, the schools serving the City had a total enrollment of approximately 41,177 students, of which 21,715 were enrolled in elementary (K-6), 6,578 were enrolled in intermediate school (grades 7-8) and 12,884 were enrolled in high school (grades 9 – 12).

District-wide CUSD Schools have a total enrollment of 42,699 students for the 2021-2022 school year. Table 3.12-5 provides a summary of the enrollment by grade within CUSD.

TABLE 3.12-5: ENROLLMENT BY GRADE CUSD (2021-2022)

SOURCE: CALIFORNIA DEPARTMENT OF EDUCATION 2021-22 ENROLLMENT BY GRADE.

The CUSD's school building capacity was determined to be 21,916 for grades TK-6, 6,561 for grades 7-8, and 12,135 for grades 9-12. The CUSD does not have existing capacity to accommodate projected students from new development. Therefore, the CUSD will need additional school facilities during the next five years for approximately 2,339 students in grades TK-6, 496 students in grades 7-8, and 1,034 students in grades 9-12 (Odell Planning, 2022).

The CUSD adopted Level I and II School Facilities (Developer) Fees in June 2022. Developer Fees are utilized to enhance and maintain existing facilities; they are also put towards construction and expansion of new facilities (CUSD, 2022B).

The City of Clovis has a unique partnership with the school districts, in which the schools provide and operate most recreation programs for the youth and teens of the community. While the schools do provide programming, the City of Clovis also operates youth and adult programs through the Clovis Recreation Center and additional programing and events for the community (City of Clovis, 2018).

Library Services

Library services are provided by Fresno County and funded by the County General Fund and countywide sales tax override. A branch library is located in the Clovis Civic Center (1155 Fifth Street). New library facilities are proposed for inclusion in each of the Urban Villages outlined in the 1993 General Plan Update (City of Clovis, 2014).

The Fresno County Public Library provides collections and services through its Central Resource Library and 34 branches. It is part of the San Joaquin Valley Library System (SJVLS), a cooperative network of 10 public library jurisdictions in the counties of Fresno, Kern, Kings, Madera, Mariposa, Merced and Tulare (FCPL, 2022A).

The Clovis branch is 8,627 square feet and is open to the public seven days a week; from 9:00 AM to 9:00 PM Mondays through Thursdays, 9:00 AM to 5:00 PM Fridays and Saturdays, and 12:00 PM to 5 PM on Sundays. The Clovis branch has ten laptops available for checkout and other technologic tools available to the public. The library offers black & white and color printing, as well as a photocopier and a recycling drop-off bin (FCPL, 2022B).

Clovis Senior Center

The Community Services Division administers various senior citizen programs at the Clovis Senior Center. The Clovis Senior Center is open to anyone age 50 or older and is located at 850 Fourth Street between the Clovis Veterans Memorial District Building and the San Joaquin Valley College of Law. Clovis Senior Services sponsors a wide range of classes, programs, and activities to promote healthy and independent living for individuals 50 years and older. No membership fee is required, although some classes and sessions have a small activity fee and/or registration fee (City of Clovis, 2022E).

Clovis Health Care Facilities.

Health care facilities within Clovis encompass Community Health Systems, Kaiser Permanente Clovis Medical Offices, residential care facilities, as well as private physicians and other medical practitioners.

Community Health System is a locally owned, not-for-profit, public-benefit organization based in Fresno, California. Four acute-care hospitals– Community Regional Medical Center, Clovis Community Medical Center, Fresno Heart & Surgical Hospital and Community Behavioral Health Center-, a cancer institute along with several long-term care, outpatient and other healthcare facilities are in operation. The Clovis Community Center is located on the northeast corner of Herndon and Temperance Avenues. The Clovis Community Medical Center houses 208 licensed beds, and has plans to add 144 more in 2022, bringing the total number of private rooms from 208 to 352 (Community Health System, 2022).

3.12.2 REGULATORY SETTING

STATE

Police Protection

There are no federal or state regulations related to police protection services applicable to the proposed Project.

Fire Protection and Emergency Response

CALIFORNIA OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION

In accordance with California Code of Regulations Title 8 Sections 1270 "Fire Prevention" and 6773 "Fire Protection and Fire Equipment" the California Occupational Safety and Health Administration (Cal/OSHA) has established minimum standards for fire suppression and emergency medical services. The standards include, but are not limited to, guidelines on the handling of highly combustible materials, fire hose sizing requirements, restrictions on the use of compressed air, access roads, and the testing, maintenance, and use of all firefighting and emergency medical equipment.

EMERGENCY RESPONSE/EVACUATION PLANS

The State passed legislation authorizing the Office of Emergency Services (OES) to prepare a Standard Emergency Management System (SEMS) program, which sets forth measures by which a jurisdiction should handle emergency disasters. Non-compliance with SEMS could result in the State withholding disaster relief from the non-complying jurisdiction in the event of an emergency disaster.

CALIFORNIA FIRE CODE

The 2019 California Fire Code contains regulations relating to construction, maintenance, and use of buildings. Topics addressed in the California Fire Code include fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire-safety requirements for new and existing buildings and the surrounding premises. The Fire Code contains specialized technical regulations related to fire and life safety.

CALIFORNIA HEALTH AND SAFETY CODE

State fire regulations are set forth in Sections 13000 et seq. of the California Health and Safety Code. This includes regulations for building standards (as also set forth in the California Building Code), fire protection and notification systems, fire protection devices such as extinguishers and smoke alarms, high-rise building and childcare facility standards, and fire suppression training.

NFPA 1710

The National Fire Protection Association (NFPA) 1710 Standards are applicable to urban areas and where staffing is comprised of career firefighters. According to these guidelines, a career fire department needs to respond within six minutes, 90 percent of the time with a response time measured from the 911 call to the time of arrival of the first responder.

The standards are divided as follows:

- Dispatch time of one minute or less for at least 90 percent of the alarms;
- Turnout time of one minute or less for EMS calls (80 seconds for fire and special operations response);
- Fire response travel time of four minutes or less for the arrival of the first arriving engine company at a fire incident and eight minutes or less travel time for the deployment of an initial full alarm assignment at a fire incident;
- Eight minutes or less travel time for the arrival of an advanced life support (ALS) (4 minutes or less if provided by the fire department.

Parks/Recreation

QUIMBY ACT

The Quimby Act (California Government Code Section 66477) states that "the legislative body of a city or county may, by ordinance, require the dedication of land or impose a requirement of the payment of fees in lieu thereof, or a combination of both, for park or recreational purposes as a condition to the approval of a tentative or parcel map." Requirements of the Quimby Act apply only to the acquisition of new parkland and do not apply to the physical development of new park facilities or associated operations and maintenance costs. The Quimby Act seeks to preserve open space needed to develop parkland and recreational facilities; however, the actual development of parks and other recreational facilities is subject to discretionary approval and is evaluated on a case-by-case basis with new residential development. The City collects impact fees at the time of building permits and final maps that include both capital impacts and land acquisition.

Schools

CALIFORNIA CODE OF REGULATIONS

The California Code of Regulations, Chapter 4.9, Payment of Fees, Charges, Dedications, or Other Requirements Against a Development Project. *Section 65995-65998 (h)* The payment or satisfaction of a fee, charge, or other requirement levied or imposed pursuant to Section 17620 of the Education Code in the amount specified in Section 65995 and, if applicable, any amounts specified in Section 65995.5 or 65995.7 are hereby deemed to be full and complete mitigation of the impacts of any legislative or adjudicative act, or both, involving, but not limited to, the planning, use, or development of real property, or any change in governmental organization or reorganization as defined in Section 56021 or 56073, on the provision of adequate school facilities.

CALIFORNIA DEPARTMENT OF EDUCATION

The California Department of Education (CDE) School Facilities Planning Division (SFPD) prepared a School Site Selection and Approval Guide that provides criteria for locating appropriate school sites in the State of California. School site and size recommendations were changed by the CDE in 2000 to reflect various changes in educational conditions, such as lowering of class sizes and use of advanced technology. The expanded use of school buildings and grounds for community and agency joint use and concern for the safety of the students and staff members also influenced the modification of the CDE recommendations.

Specific recommendations for school size are provided in the School Site Analysis and Development Guide. This document suggests a ratio of 1:2 between buildings and land. CDE is aware that in a number of cases, primarily in urban settings, smaller sites cannot accommodate this ratio. In such cases, the SFPD may approve an amount of acreage less than the recommended gross site size and building-to-ground ratio.

Certain health and safety requirements for school site selection are governed by state regulations and the policies of the SFPD relating to:

- Proximity to airports, high-voltage power transmission lines, railroads, and major roadways;

- Presence of toxic and hazardous substances;
- Hazardous facilities and hazardous air emissions within one-quarter mile;
- Proximity to high-pressure natural gas lines, propane storage facilities, gasoline lines, pressurized sewer lines, or high-pressure water pipelines;
- Noise;
- Results of geological studies or soil analyses; and
- Traffic and school bus safety issues.

THE KINDERGARTEN-COMMUNITY COLLEGE PUBLIC EDUCATION FACILITIES BOND ACT OF 2016 (PROP 51)

The Kindergarten-Community College Public Education Facilities Bond Act of 2016 was the first education-related bond measure to appear on the ballot since 2006. This act was approved by California voters in November 2016 and provided for a bond issued of $9 billion with $7.0 billion earmarked for K-12 school facilities and $2 billion earmarked for community college facilities. The $7.0 billion for K-12 school facilities was allocated as follows: $3 billion for the construction of new school facilities, $500 million for providing school facilities for charter schools, $3 billion for the modernization of school facilities, and $500 million for providing facilities for career technical education programs. The $2 billion allocated to community college facilities was for acquiring, constructing, renovating, and equipping community college facilities.

LEROY F. GREENE SCHOOL FACILITIES ACT OF 1998 (SB 50)

The "Leroy F. Greene School Facilities Act of 1998," also known as Senate Bill 50 or SB 50 (Chapter 407, Statutes of 1998), governs a school district's authority to levy school impact fees. This comprehensive legislation, together with the $9.2 billion education bond act approved by the voters in November 1998 known as "Proposition 1A," reformed methods of school construction financing in California. SB 50 instituted a new school facility program by which school districts can apply for state construction and modernization funds. It imposed limitations on the power of cities and counties to require mitigation of school facilities impacts as a condition of approving new development and provided the authority for school districts to levy fees at three different levels:

- Level I fees are the current statutory fees allowed under Education Code 17620. This code section provides the basic authority for school districts to levy a fee against residential and commercial construction for the purpose of funding school construction or reconstruction of facilities. These fees vary by district for residential construction and commercial construction and are increased biannually.

- Level II fees are outlined in Government Code Section 65995.5, allowing school districts to impose a higher fee on residential construction if certain conditions are met. These conditions include having a substantial percentage of students on multi-track year-round scheduling, having an assumed debt equal to 15–30 percent of the district's bonding capacity (percentage is based on revenue sources for repayment), having at least 20 percent of the district's teaching stations housed in relocatable classrooms, and having placed a local bond on the ballot in the past four years which received at least 50 percent plus one of the votes cast. A Facility Needs Assessment must demonstrate the need for new school facilities for unhoused pupils is attributable to projected enrollment growth from the construction of new residential units over the next five years.

Level III fees are outlined in Government Code Section 655995.7. If State funding becomes unavailable, this code section authorizes a school district that has been approved to collect Level II fees to collect a higher fee on residential construction. This fee is equal to twice the amount of Level II fees. However, if a district eventually receives State funding, this excess fee may be reimbursed to the developers or subtracted from the amount of state funding.

LOCAL

City of Clovis Municipal Code

Municipal Code Chapter 3.4, Park Acquisition and Development, establishes a method for coordinated acquisition and development of City park facilities. This Chapter states that any residential projects shall pay parks acquisition and development fees per dwelling unit.

Title 4 of the City Municipal Code is dedicated to Public Safety. The purposes of Chapter 4.2, Emergency Services, are to provide for the preparation and carrying out of plans for the protection of persons and property within the City in the event of an emergency; the direction of the Emergency Organization; and the coordination of the emergency functions of the City with all other public agencies, corporations, organizations, and affected private persons. Chapters 4.3 and 4.4 pertain to Fire Department and Fire Prevention; Chapter 4.4 codifies the adoption of the California Fire Code. Chapter 4.10, Fire Facility Development Impact Fee, claims that any owner/developer who constructs or causes a dwelling unit or a “dwelling unit equivalent” to be constructed in the City shall pay a fire department fee in addition to any other fees required to be paid by the City. Chapter 4.11, Police Department Fee, mirrors Chapter 4.10 in that this Chapter requires the payment of a fee for a specific public service, in the case of Chapter 4.11, the fee goes towards police facilities.

The purpose of Chapter 7.8, Library Facilities Development Impact Fees, is to create and establish a library facilities development impact fee (“library fee”) for the City, which shall be used to mitigate adverse impacts to public library facilities and equipment attributed to new development. The library fee shall be used by the City to pay a portion of the costs of designated library facilities and equipment impacted by new development. The library fee shall be based on a method designed to ensure that developers pay their fair share of the cost of such library facilities and equipment required to serve the City’s growing population.

Section 9.22.060, Fire protection, is under Chapter 9.22, Performance Standards. Section 9.22.060 explains that all new or modified development shall be built per the currently adopted California Fire Code, related Municipal Code provisions, and current Clovis Fire Code standards and policies.

Title 10 is dedicated to Parks and Recreation. This title regulates street trees and plants (Chapter 10.1); use of City parks and other City public facilities (Chapter 10.2); prohibited acts (Chapter 10.3); violations (Chapter 10.4); and skate park facilities (Chapter10.5).

Clovis Parks Master Plan (2018)

The City of Clovis Parks Master Plan provides strategic guidance in the provision of parks services to best develop, promote, utilize, manage, and maintain a functional park system for the City of Clovis. The master plan will guide policy development, prioritize demands and opportunities, and generate a strategic action plan for the next 5 to 10 years. The Plan addresses current and aging areas of the City park system, as well as future growth of the City and identifies opportunities that will expand and complement the City Parks Division and address the needs of the community.

City of Clovis General Plan

The General Plan includes several policies relevant to public services. It is noted that the currently adopted General Plan is the City of Clovis General Plan, adopted in August 2014; policies applicable to the Project are identified below:

Land Use Element

- Policy 6.1 Amendment criteria. The City Council may approve amendments to the General Plan when the City Council is satisfied that the following conditions are met:
    - A. The proposed change is and will be fiscally neutral or positive.
    - B. The proposed change can be adequately served by public facilities and would not negatively impact service on existing development or the ability to service future development.
    - C. The proposed change is consistent with the Urban Village Neighborhood Concept when within an Urban Center.
    - D. General Plan amendments proposing a change from industrial, mixed-use business campus, or office (employment generating) land use designations to non-employment-generating land use designation shall be accompanied by an analysis of the potential impacts on the City's current and long-term jobs-housing ratio, as well as an evaluation on the change or loss in the types of jobs.
    - E. This policy does not apply to:
        - i. County designations within the Clovis Planning Area or changes made by the City Council outside of the sphere boundary to reflect changes made by the County of Fresno.
        - ii. Changes initiated by public agencies (such as school districts, flood control) for use by public agencies.
        - iii. Changes initiated by the city within a specific plan.

Circulation Element

- Policy 1.3 Age and mobility. The design of roadways shall consider all potential users, including children, seniors, and persons with disabilities.
- Policy 1.5 Neighborhood connectivity. The transportation network shall provide multimodal access between neighborhoods and neighborhood-serving uses (educational, recreational, or neighborhood commercial uses).

Public Facilities and Services Element

- Policy 1.1 New development. New development shall pay its fair share of public facility and infrastructure improvements.
- Policy 1.4 Development-funded facilities. The City may require developments to install onsite or offsite facilities that are in excess of a development's fair share. However, the City shall establish a funding mechanism for future development to reimburse the original development for the amount in excess of the fair share costs.
- Policy 3.4 Joint use of facilities. Partner with public and private educational institutions to jointly use facilities for both civic and educational purposes.
- Policy 4.3 Lifelong learning. Enhance and expand Clovis' library facilities to meet the evolving educational and lifelong learning needs of the community. Coordinate with local educational institutions to offer courses and learning opportunities outside the classroom.
- Policy 4.4 Recreation programs. Provide and/or sponsor recreational programs and services that are accessible and affordable to residents of all ages and abilities and encourage active and healthy living.
- Policy 4.5 Youth programs. Coordinate with public and private schools, local nonprofits, service clubs, and other agencies to provide opportunities for youth to explore and enjoy sports, creative and performing arts, future career paths, civic activities, and volunteer opportunities.
- Policy 4.6 Senior programs. Collaborate with service providers to provide a wide variety of senior services and programs, including daily opportunities for seniors to have physical activity, social interaction, and mental stimulation.
- Policy 4.7 Childcare and childhood development. Encourage efforts to expand the overall capacity of and access to local childcare and early childhood development centers.
- Policy 4.8 Access to community facilities. Improve transit connections to community facilities for people who are transit-dependent.
- Policy 5.9 Proximity to emergency medical services. Require senior care facilities and other services providers that may need frequent emergency medical services to locate in proximity to fire stations and medical service providers.
- Policy 6.1 Fire and police service. Maintain staffing, facilities, and training activities to effectively respond to emergency and general public service calls.
- Policy 6.2 Resource allocation. Periodically conduct service level studies to analyze crime and emergency service performance data, to evaluate the effectiveness of prevention and reduction strategies, and to allocate resources accordingly.
- Policy 6.3 Emergency medical calls. Explore options to lessen the demand on fire and police services or expand reimbursement programs to ensure the service pays for measured impacts.
- Policy 6.4 Skilled medical facilities. Consider options to offset or apportion the higher cost of providing emergency medical service to facilities with existing skilled medical personnel on staff.

- Policy 6.5 Public safety hot spots. Prioritize improvement and enforcement activities to minimize existing and prevent future public safety hot spots. Reevaluate siting and development standards for facilities that generate high demands for service calls.
- Policy 6.6 Interagency support. Participate in mutual aid system and automatic aid agreements to back up and supplement capabilities to respond to emergencies.
- Policy 6.7 Interagency communications. Maintain an effective communication system between emergency service providers within Clovis and neighboring jurisdictions.
- Policy 6.8 Emergency preparedness planning. Maintain an emergency operations plan, an emergency operations center, and a hazard mitigation plan to prepare for actual or threatened conditions of disaster or extreme peril.
- Policy 6.9 Community outreach. Conduct outreach in the community to promote personal and public safety in daily life and in cases of emergency. Regularly update and inform the public on the real levels of crime and safety to strengthen their perceived sense of personal security.

Environmental Safety Element

- Policy 1.5 Critical and public facilities. Locate and design critical and public facilities to minimize their exposure and susceptibility to flooding, seismic and geological effects, fire, and explosions. Ensure critical use facilities (e.g., hospital, police, and fire facilities) can remain operational during an emergency.
- Policy 1.6 Public information and emergency preparedness. Provide the public with accurate and reliable information regarding natural hazards to prevent and mitigate potential risks and exposure for life and property. Continue to maintain a local hazard mitigation plan and conduct programs to inform the general public of the City's emergency preparedness and disaster response procedures.

Open Space and Conservation Element

- Policy 1.1 Parkland standard. Provide a minimum of 4 acres of public parkland for every 1,000 residents.
- Policy 1.2 Existing parks. Upgrade and rehabilitate existing parks as necessary to meet the needs of the community and as the financial resources of the city allow.
- Policy 1.3 New parks and recreation facilities. Provide a variety of parks and recreation facilities in underserved and growing areas of the community.
- Policy 1.4 Joint use of education facilities. Provide a balanced system of parks and recreation facilities through joint use of facilities owned by school districts.
- Policy 1.5 Multipurpose open space. Design public facilities as multipurpose open space and recreation to serve the community's infrastructure needs while preserving and enhancing open space and water features. Prioritize the use of existing basins for existing areas, and for future areas prioritize the development of separate park facilities available year-round.
- Policy 1.7 Sustainability. Develop new and maintain existing parks and recreation facilities to achieve fiscal and environmental sustainability.
- Policy 1.8 Funding. Require new development to provide pocket and neighborhood parks, dedicate land for area parks, and pay impact fees for community and regional parks. Require

new development to establish lighting and landscape maintenance districts to fund operations and maintenance.

- Policy 1.9 Master plan. Periodically update the Parks Master Plan to direct the implementation of the city's open space facilities.

3.12.3 IMPACTS AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the proposed Project will have a significant impact on public services if it would result in:

- Substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:
    - Fire Protection;
    - Police Protection;
    - Schools;
    - Parks; and
    - Other public facilities.
- An increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated; or
- If it includes recreational facilities or requires the construction or expansion of recreational facilities, which might have an adverse physical effect on the environment.

IMPACTS AND MITIGATION MEASURES

Impact 3.12-1: The proposed Project has the potential to require the construction of police department facilities which may cause substantial adverse physical environmental impacts. (Less than Significant)

The proposed Project would introduce new residential uses and residents to the City. The Project proposes 605 single-family units be developed. This will create an increased demand for police protection services compared to existing conditions. The City's Existing General Plan designates the Development Area as Rural Residential (RR) and therefore, anticipated potential development in and around the area. To the extent that the Project would have an incremental increase in demand on police protection services provided by the CPD, the Project would be required to pay the police facility fee in accordance with Clovis Municipal Code Chapter 4.11, Police Department Fees. The fee is imposed on residential development within the City for the purposes of assuring that the current level of service goals of the City are met with respect to additional demands placed on police facilities from such development.

According to the most recent Department of Finance (2022) estimates, the Clovis population is 123,665 and the average number of persons residing in a dwelling unit is 2.81; therefore, the Project is estimated to increase the population by 1,700 residents (based on 2.81 persons per household). As of 2021, the CPD has 102 sworn officers (CPD, 2021B). With the addition of 1,700 residents, that equates to a staffing level of approximately 0.81 officers per 1,000 residents. This is not a significant change from the current service ratio of 0.82 officers per 1,000 residents. The City has anticipated additional officers would be hired as the City population grows. The City and CPD periodically monitor response times and reports annually on the results to ensure adequate police protection service levels are provided.

Impact fees from new development are collected based upon projected impacts from each development. The adequacy of impact fees is reviewed periodically to ensure that the fee is commensurate with the service. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund capital and labor costs associated with police services.

The Project does not propose and would not create a need for new or physically altered police protection facilities to maintain acceptable service ratios, response times, or other performance objectives. Therefore, the Project would not result in adverse physical impacts associated with such facilities. The Project would be required to pay the City's development fee specific to police, which in accordance with the Clovis Municipal Code, shall be used solely and exclusively for the purpose of funding police station improvements. Payment of the fee would offset the incremental increase in demand for police protection services associated with the Project. In addition, the Development Area would be required to annex into the City of Clovis Public Safety Community Facilities District.

Based on the ability of the CPD to serve the City, it is anticipated that the existing police department facilities are sufficient to serve the proposed Project and the construction of new or expanded police department facilities would not be required. Consequently, any impacts would be **less than significant**.

Impact 3.12-2: The proposed Project has the potential to require the construction of fire department facilities which may cause substantial adverse physical environmental impacts. (Less than Significant)

The CFD will be the responding agency to fires and emergencies at the Project site. For low-risk fires, three CFD personnel will respond; moderate risk structure fires will have a response of 16 CFD personnel, and high risk structure fires will have a response of 19 CFD personnel. Three personnel will respond to all low and moderate risk EMS incidents. Low and moderate risk technical rescue and hazardous materials (HazMat) incidents will receive three personnel; ten personnel will respond to high-risk technical rescue and HazMat incidents (CFD, 2017). Average response times for the CFD are presented in Table 3.12-2. As shown in Table 3.12-2, as of 2021, the CFD did not meet or exceed its response-time goals, as it has in past years. While the CFD has not met response time goals as of 2021, the Department has recently opened a new station (Station 6) for commission. Station 6 opened in August of 2022, and allows the CFD to serve more people within their jurisdiction at a faster rate (CFD, 2021).

The proposed Project would introduce new residential uses to the City (i.e. 605 single-family residences). This would create an increased demand for fire services compared to existing conditions. The City's Existing General Plan designates the Development Area as Rural Residential (RR) and therefore, anticipated potential development. Although a General Plan Amendment would be required as part of the proposed Project, to the extent that the Project would have an incremental increase in demand on fire services provided by the CFD, the Project would be required to pay the community facility fee in accordance with Clovis Municipal Code Chapter 4.10, Fire Facility Development Impact Fee. The fee is imposed on residential development within the City for the purposes of assuring that the current level of service goals of the City are met with respect to additional demands placed on fire facilities from such development.

The Project does not propose and would not create a need for new or physically altered fire protection facilities to maintain acceptable service ratios, response times, or other performance objectives. Development fees from new development are collected based upon projected impacts from each development. The adequacy of impact fees is reviewed periodically to ensure that the fee is commensurate with the service. In addition, the Project Site would be required to annex into the city of Clovis Public Safety Community Facilities District. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund capital and labor costs associated with fire protection services. Therefore, the impact of the proposed Project on the need for additional fire services facilities is **less than significant** and would not require the construction of additional fire department facilities.

Impact 3.12-3: The proposed Project has the potential to require the construction of school facilities which may cause substantial adverse physical environmental impacts. (Less than Significant)

The proposed Project is located within the service boundaries of the CUSD. Specifically, the Project site is nearest to Woods Elementary, approximately one mile southwest of the Project site, and Buchanan High School, approximately 1.7 miles southwest of the Project site.

The proposed Project would provide up to 605 residential units, which would directly cause population growth, including school-aged children that would attend the schools that serve the Project site and surrounding area. Utilizing the student generation rates provided by the CUSD in the Development Fee Justification Study/School Facilities Needs Analysis (dated April 2022), the proposed Project would be expected to generate roughly 342 new students[5], broken down by grades as follows:

- TK–6: 205 students
- 7-8: 48 students
- 9-12: 90 students

Students within the Project site would most likely attend Woods Elementary and Buchanan High School, as they are the closest educational locations to the Project site. However, student placement is subject to CUSD's determination.

The CUSD's school building capacity was determined to be 21,916 for grades TK-6, 6,561 for grades 7-8, and 12,135 for grades 9-12. The CUSD does not have existing capacity to accommodate projected students from new development. Therefore, the CUSD will need additional school facilities during the next five years for approximately 2,339 students in grades TK-6, 496 students in grades 7-8, and 1,034 students in grades 9-12. The CUSD currently owns four elementary school sites (Fowler-McKinley, Minnewawa-Perrin, Minnewawa-International, and an elementary site in the Millerton Specific Plan Area) as well as the Bradley Educational Center site, which would accommodate a future high school, intermediate school, and elementary school. The CUSD, therefore, has school site capacity for all projected students in all grade levels, and thus no site acquisition costs are needed. (Odell, 2022).

School districts are authorized to collect fees on new residential and commercial/industrial development in accordance with Education Code Section 17620 and Government Code Section 65995. This Development Fee Justification Study/School Facilities Needs Analysis provides the information and analysis necessary to demonstrate that the CUSD is justified in collecting Level I fees on new residential and commercial/industrial development ($4.79 and $0.78 per square foot, respectively), and Level II and Level III fees of $5.36 per square foot and $10.73 per square foot for residential development, respectively. (Odell, 2022). The CUSD adopted Level I and II School Facilities (Developer) Fees in June 2022 (CUSD, 2022B). The development fees collected by the CUSD may be used for construction and reconstruction of school facilities, site development, relocatable classrooms on existing or future sites and other facilities necessitated by students generated by new development (Odell, 2022).

Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from taxes, would fund capital and labor costs associated with school services. The adequacy

---

[5] Calculations based on the CUSD Development Fee Justification Study/School Facilities Needs Analysis (2022), which states that Single family residential development generates an average of 0.3395 students grades TK-6; 0.0793 students for grades 7-8; and 0.1473 students for grades 9-12 per unit.

of fees is reviewed on an annual basis to ensure that the fee is commensurate with the service. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund improvements associated with school services. According to Government Code Section 65996, the development fees authorized by SB 50 (1998) are deemed to be "full and complete school facilities mitigation" for any demands or impacts on school facilities caused by new development Therefore, the impact of the proposed Project on the need for additional school facilities is **less than significant**.

Impact 3.12-4: The proposed Project has the potential to have effects on other public facilities. (Less than Significant)

The proposed Project will bring residents to the area which may require the use of other public services such as libraries, civic centers, etc. Public services such as the Clovis branch of the Fresno County Public Library and the Clovis Senior Center would serve Project residents. The City collects impact fees from new development based upon projected impacts from each development, including impacts on other public services as required by Chapter 3.10, Development Impact Fees and Chapter 7.8, Library Facilities Development Impact Fees of the City's Municipal Code. The City reviews the adequacy of impact fees on an annual basis to ensure that the fee is commensurate with services provided. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund capital and labor costs associated with these other public services.

The proposed Project does not trigger the need for new facilities associated with other public services. Consequently, new facilities for other public services are not proposed at this time. The proposed Project would not result in the need for new facilities for other public services, thus it will have a **less than significant** impact relative to this topic.

Impact 3.12-5: The proposed Project has the potential to require the construction of park and recreational facilities which may cause substantial adverse physical environmental impacts. (Less than Significant)

The proposed Project directly increases the number of persons in the area as a result of new residential development. The proposed Project provides 605 single-family residential units. According to the most recent Department of Finance (2022) estimates, the average number of persons residing in a dwelling unit in the City of Clovis is 2.81; therefore, the Project is estimated to increase the population by 1,700 residents (based on 2.81 persons per household).

The City's General Plan identifies a park standard based on a goal of four acres of parkland per 1,000 residents within the City limits. The Project proposes to include open space totaling approximately 5.54 acres on-site, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, which would not provide the park land needed to meet the four acres per 1,000 people. However, Municipal Code Chapter 3.4, Park Acquisition and Development, states that any developer who plans for dwelling units to be constructed in the City shall pay, in addition to any other fees required to be paid by the City, a fee which shall be calculated on the basis of park acreage designated in the Clovis General Plan consisting of the estimated total land acquisition and construction cost distributed on the basis of the remaining developable area within the sphere of influence. In accordance with the Municipal Code, fees are deposited in specific funds that shall be used solely for the acquisition, improvement and expansion of public parks and recreation facilities as outlined in the park acquisition and improvement fee update. Thus, upon provision and dedication of the proposed parkland and/or payment of required fees in accordance with the Clovis Municipal Code Chapter 3.04, and other Municipal Code policies, the proposed Project will result in a **less than significant** impact.

Impact 3.12-6: The proposed Project has the potential to increase the use of existing neighborhood and regional parks or other recreational facilities, such that substantial physical deterioration of the facility would occur or be accelerated. (Less than Significant)

As stated previously, the proposed Project will directly increase the number of persons in the area through the addition of 605 new residential units. The Project also provides open space on-site, totaling 5.54 acres, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, and will pay park impact fees according to Municipal Code Chapters 3.04 and 3.10. It is not anticipated that the proposed Project would result in a significant increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial deterioration would occur because the Project includes new recreational facilities for residents within the Project site, and provides funding to existing park facilities through required fees.

The proposed Project would not significantly increase the use of an existing park, or other recreational facility. Therefore, it is not anticipated that any substantial physical deterioration of existing facilities would occur or be accelerated. As such, the proposed Project would have a **less than significant** impact relative to this topic.

This page left intentionally blank.

TRANSPORTATION AND CIRCULATION 3.13

This section of the EIR analyzes the potential impacts of the proposed Project on the surrounding transportation system including roadways, bicycle/pedestrian facilities, rail, and transit facilities/services. This section identifies the significant impacts of the proposed Project. An evaluation of vehicular access to the proposed Project is also provided. All technical calculations are in the Transportation Analysis Report prepared by LSA for the proposed Project (provided in Appendix I of this EIR).

Comments were received during the public review period or scoping meetings for the Notice of Preparation regarding this topic. Each of the comments related to this topic are addressed within this section. Full comments received are included in Appendix A.

3.13.1 INTRODUCTION

PROJECT LOCATION

The Shepherd North Project (Project) site is located directly north of the City of Clovis limit line at the northeast corner of North Sunnyside Avenue and East Shepherd Avenue. The Project site is bounded on the north by Perrin Road, on the east by North Fowler Avenue, on the south by East Shepherd Avenue, and on the west by North Sunnyside Avenue. Figures 2.0-1 and 2.0-2 show the proposed Project's regional location and vicinity. The Project site is in the southwest quadrant of Section 21, Township 12 South, Range 21 East, Mount Diablo Base and Meridian (MDBM). Figure 2.0-3 illustrates the Project location on the USGS Clovis, California, 7.5-minute series quadrangle map.

PROJECT SITE DEFINED

The Project site includes several distinct planning boundaries. The following terms are used throughout this document to describe planning area boundaries within the Project site:

- Project Area – Includes the whole of the Project site (approximately 155 acres), encompassing the approximate 77-acre Development Area and the approximate 78-acre Non-Development Area.
    - Development Area - Includes the parcels being annexed that will be entitled for subdivision and development. This will include a Sphere of Influence (SOI) Expansion, General Plan Amendment, Pre-zone, Annexation/Reorganization, Tentative Tract Map, Planned Development Permit, and Residential Site Plan Review.
    - Non-Development Area - Includes the parcels being included in the SOI expansion that will not be entitled for subdivision or development. This includes two separate areas, each described as an Expansion SubArea. The two Expansion SubAreas total 78 acres and are defined as Expansion SubArea North and Expansion SubArea East.

STUDY AREA

The Local Transportation Analysis (LTA) for the project examines traffic operations in the vicinity of the proposed Project under the following five scenarios:

- Existing Conditions
- Existing Plus Project Conditions
- Near-Term Plus Project Conditions
- Cumulative without Project Conditions
- Cumulative Plus Project Conditions

Traffic conditions at study intersections and roadway segments were examined for weekday a.m. and p.m. peak-hour conditions. The a.m. peak hour is defined as the 1 hour of highest traffic volumes occurring between 7:00 a.m. and 9:00 a.m. The p.m. peak hour is the 1 hour of highest traffic volumes occurring between 4:00 p.m. and 6:00 p.m. Additionally, since the Project is estimated to be completed in 2028, the Near-Term condition was evaluated for the year 2028.

As per the City’s Transportation Impact Analysis (TIA) Guidelines, the extent of the ‘Study Area’ includes the following:

- Pedestrian, bicycle, and transit facilities within 0.5 mile from the project site boundary
- All intersections of major streets that would provide direct access to the Project
- All signalized intersections within 0.5 mile of the Project site boundary where the project would add 50 or more peak-hour trips, and signalized intersections beyond 0.5 mile where the project would add 100 or more peak-hour trips
- All unsignalized intersections within a 0.5 mile of the project site boundary where the project would add more than 50 peak-hour trips

Based on the aforementioned criteria and as per discussion with the City and adjacent jurisdictions during the scoping agreement process, the following intersections and roadway segments have been included in the LTA. Figure 3.13-1 illustrates the Study Area Roadway Classifications.

Study Intersections

Twenty-six existing intersections were selected for study. The study intersections include:

1. Willow Avenue/Behymer Avenue (Clovis/Fresno)
2. Willow Avenue/Shepherd Avenue (Clovis/ Fresno)
3. Minnewawa Avenue/Behymer Avenue (Clovis)
4. Minnewawa Avenue/Shepherd Avenue (Clovis)
5. Clovis Avenue/Shepherd Avenue (Clovis)
6. Clovis Avenue/Teague Avenue (Clovis)
7. Clovis Avenue/Nees Avenue (Clovis)
8. Clovis Avenue/Alluvial Avenue (Clovis)

9. State Route 168 (SR-168) Westbound Ramps/Herndon Avenue (Caltrans)
10. SR-168 Eastbound Ramps/Herndon Avenue (Caltrans)
11. Clovis Avenue/Herndon Avenue (Clovis)
12. Sunnyside Avenue/Behymer Avenue (Clovis)
13. Sunnyside Avenue/Shepherd Avenue (Clovis)
14. Sunnyside Avenue/Teague Avenue (Clovis)
15. Sunnyside Avenue/Nees Avenue (Clovis)
16. Fowler Avenue/Behymer Avenue (Clovis)
17. Fowler Avenue/Ticonderoga (Clovis)
18. Fowler Avenue/Shepherd Avenue (Clovis)
19. Fowler Avenue/Teague Avenue (Clovis)
20. Fowler Avenue/Nees Avenue (Clovis)
21. Fowler Avenue/SR-168 Westbound Ramps (Caltrans)
22. Fowler Avenue/SR-168 Eastbound Ramps (Caltrans)
23. Sunnyside Avenue/Project Driveway 1 (Clovis)
24. Sunnyside Avenue/Project Driveway 2 (Clovis)
25. Project Driveway 3/Shepherd Avenue (Clovis)
26. Project Driveway 4-Stanford Avenue/Perrin Road (Clovis)

Roadway Segments

Twenty-three roadway segments were analyzed in the LTA. The roadway segments include:

1. Behymer Avenue, between Willow Avenue and Minnewawa Avenue (Clovis)
2. Behymer Avenue, between Minnewawa Avenue and Sunnyside Avenue (Clovis)
3. Behymer Avenue, between Sunnyside Avenue and Fowler Avenue (Clovis)
4. Shepherd Avenue, between Willow Avenue and Minnewawa Avenue (Clovis)
5. Shepherd Avenue, between Minnewawa Avenue and Clovis Avenue (Clovis)
6. Shepherd Avenue, between Clovis Avenue and Sunnyside Avenue (Clovis)
7. Shepherd Avenue, between Sunnyside Avenue and Project Driveway 3 (Clovis)
8. Shepherd Avenue, between Project Driveway 3 and Fowler Avenue (Clovis)
9. Herndon Avenue, between State Route 168 Eastbound Ramps and Clovis Avenue (Clovis)
10. Willow Avenue, between Behymer Avenue and Shepherd Avenue (Clovis/Fresno)
11. Minnewawa Avenue, between Behymer Avenue and Shepherd Avenue (Clovis)
12. Clovis Avenue, between Shepherd Avenue and Teague Avenue (Clovis)
13. Clovis Avenue, between Teague Avenue and Nees Avenue (Clovis)
14. Clovis Avenue, between Nees Avenue and Alluvial Avenue (Clovis)
15. Clovis Avenue, between Alluvial Avenue and Herndon Avenue (Clovis)
16. Sunnyside Avenue, between Project Driveway 1 and Shepherd Avenue (Clovis)
17. Sunnyside Avenue, between Shepherd Avenue and Teague Avenue (Clovis)
18. Sunnyside Avenue, between Teague Avenue and Nees Avenue (Clovis)
19. Fowler Avenue, between Behymer Avenue and Ticonderoga (Clovis)

20. Fowler Avenue, between Ticonderoga and Shepherd Avenue (Clovis)
21. Fowler Avenue, between Shepherd Avenue and Teague Avenue (Clovis)
22. Fowler Avenue, between Teague Avenue and Nees Avenue (Clovis)
23. Fowler Avenue, between Nees Avenue and State Route 168 Westbound Ramps (Clovis)

For each roadway segment, the highest volume on any part of the segment has been considered as the analysis volume for the entire segment.

STUDY SCENARIOS

The study intersections were evaluated for the following five scenarios:

1. ***Existing Conditions*** – Analyzes operations as they exist today.
2. ***Existing Plus Project Conditions*** – Analyzes existing operations with the addition of trips generated from the Development Area.
3. ***Near-Term Plus Project Conditions*** – Analyzes cumulative year volumes with the addition of trips generated from the Development Area in the near-term (2028)
4. ***Cumulative No Project Conditions*** – Analyzes cumulative year volumes based on the forecast volumes obtained from the Fresno Council of Governments.
5. ***Cumulative Plus Project Conditions*** – Analyzes cumulative year volumes with the addition of trips generated from the Development Area in the long-term (2046).

3.13.2 ANALYSIS METHODOLOGY

DATA COLLECTION

Traffic volumes for Existing Conditions are typically developed using existing count data collected at Study Area intersections and roadway segments.

Traffic volumes under Near-Term Plus Project Conditions were developed by adding traffic volumes from approved and pending projects located near the Study Area and Project traffic to existing traffic volumes.

Traffic volumes for cumulative year without project conditions were developed by using forecast volumes obtained from the Fresno COG ABM. The methodology to develop cumulative year without project traffic volumes at Study Area intersections and roadway segments were consistent with the COG's procedures for post-processing of modeled traffic volumes. The resulting intersection and roadway segment LOS will be calculated using the previously discussed methodologies.

Existing and Cumulative year Plus Project traffic volumes were developed by adding Project traffic to the traffic volumes for the corresponding without Project scenarios.

VMT ANALYSIS METHODOLOGY

On December 28, 2018, the California Office of Administrative Law cleared the revised CEQA Guidelines for use. Among the changes to the CEQA Guidelines was the removal of vehicle delay and LOS from consideration under CEQA. With the adopted CEQA Guidelines, transportation impacts are to be evaluated based on a project's effect on VMT. The City's TIA Guidelines includes screening criteria, VMT analysis methodology, VMT impact thresholds, and VMT mitigation measures. Therefore, the City's TIA Guidelines were used in the evaluation of the Project's VMT analysis.

VMT METHODOLOGY

The TIA Guidelines provide multiple project types and thresholds for land use projects. The Project was compared with the screening criteria established in the "Project Screening" section of the TIA Guidelines to check if the project can be screened out. The following is a brief description of the project in relation with the project screening criteria:

Small Project: The TIA Guidelines states that projects generating less than 500 daily trips could be screened out of a detailed VMT analysis. As discussed in Section 6.1, Project Trip Generation, the project is estimated to generate 5,705 daily trips. Therefore, the Project does not satisfy this screening criteria.

- **Provision of Affordable Housing:** The project proposes to develop market-rate, single-family dwelling units. Therefore, this screening criteria does not apply to the project.
- **Local-Serving Retail:** The project consists of residential land use only; therefore, this screening criteria does not apply to the project.
- **Project Located in a High-Quality Transit Area (HQTA):** The project is not located within an HQTA; therefore, this screening criteria does not apply to the project.
- **Project Located in Low VMT Area:** The project is not located in a low VMT area; therefore, this criteria does not apply to the project.

As shown above, the Project could not be screened out from a detailed VMT analysis. As such, pursuant to the TIA Guidelines, a detailed VMT analysis was conducted to assess the Project's VMT impact.

THRESHOLDS OF SIGNIFICANCE

The Project consists of residential land use. The TIA Guidelines established VMT per capita as the appropriate metric to evaluate residential land use projects while defining Fresno County as the "region" for determining VMT thresholds. The Project would have a significant VMT impact if the baseline Project VMT per capita is greater than 87 percent of the baseline Fresno County VMT per capita. Based on the TIA Guidelines, baseline City of Clovis VMT per capita is 16.1 and the corresponding threshold is 14.1 (which is 87 percent of 16.1). Therefore, the Project will have a significant VMT impact if the Project VMT per capita is greater than 14.1.

As recommended in the TIA Guidelines, the Fresno COG ABM was used for the Project VMT analysis. The model inputs were updated with the Project land uses to calculate Project VMT. The Project VMT was calculated from a Fresno COG ABM model run as described in the following sections.

LOCAL TRANSPORTATION ANALYSIS METHODOLOGY

Study intersections were analyzed using procedures and methodologies contained in the Highway Capacity Manual – 6th Edition (Transportation Research Board, 2016). These methodologies were applied using Synchro 11 software which considers traffic volumes, lane configurations, signal timings, signal coordination, and other pertinent parameters of intersection operations.

Level of Service (LOS)

The operational performance of the roadway network is commonly described with the term Level of Service (LOS). LOS is a qualitative measure of traffic operating conditions whereby a letter grade, from A (the best) to F (the worst), is assigned. These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with driving. In general, LOS A represents free-flow conditions with no congestion, and LOS F represents severe congestion and delay under stop-and-go conditions. For signalized intersections, roundabouts and all way stop control intersections, LOS is based on the average delay experienced by all vehicles passing through the intersection:

- **Signalized Intersections**
    - If the project triggers a signalized intersection operating at an acceptable LOS to operate at an unacceptable LOS;
    - If the project increases the average delay for average delay for a signalized intersection that is already operating at an unacceptable LOS.
- **Unsignalized Intersections**
    - If the project triggers an unsignalized intersection operating at acceptable LOS to operate at unacceptable LOS (from E or better to F) and meet the signal warrants criteria;
    - If the project increases the applicable delay for an unsignalized study intersection that is already operating at unacceptable LOS and meets the signal warrant criteria.

The City of Clovis considers LOS D as the LOS standard for study intersections and roadway segments under near-term conditions, unless a finding of overriding consideration was adopted in the City’s General Plan EIR. The same criterion holds for long-term conditions, except for roadway segments that are adopted in the City’s General Plan EIR to operate at LOS E or F. The City’s TIA Guidelines do not define an LOS standard under Existing Plus Project conditions. For the purpose of this analysis, an LOS standard of D has been considered for intersections and roadway segments under Existing Plus Project conditions. The City of Clovis considers the following operational deficiency criteria for study intersections.

Per the City of Fresno Traffic Impact Study Report Guidelines, updated February 2009, LOS D is considered the LOS standard for study intersections and roadway segments under near-term conditions. The same criterion holds for long-term conditions, except for roadway segments that are adopted in the City’s Master General Plan to operate at LOS E or F. The City’s TIA Guidelines do not define an LOS standard under Existing Plus Project conditions.

It should be noted that all City of Fresno study intersections and roadway segments are located within the City of Fresno Traffic Impact Zone (TIZ) III. Per the City of Fresno's General Plan, all intersections and roadway segments within TIZ III should maintain a peak-hour LOS standard of D or better. Therefore, an LOS standard of D has been considered for intersections and roadway segments within Fresno for all analysis conditions. The City of Fresno considers the following operational deficiency criteria for study intersections:

- An operational deficiency is created if the addition of the Project traffic results in any one of the following:
    - Causes the intersection LOS to change from acceptable to unacceptable levels;
    - Causes the intersection LOS to change from an unacceptable LOS (LOS E) to LOS F;
    - Increases the average delay at a study intersection that is already operating at an unacceptable LOS.

City of Fresno's Traffic Impact Study guidelines do not define an operational deficiency criterion for roadway segments. Therefore, for purposes of this analysis, at intersections under City of Fresno jurisdiction, an operational deficiency has been considered when the project causes an unsatisfactory condition (deterioration from LOS A through D to E or F) or when the project contributes to an existing or forecast deficiency.

Caltrans considers an acceptable LOS to be between LOS C and D at all intersections under its jurisdiction (delay of 45 seconds at signalized intersections). Caltrans does not have any operational deficiency criteria for study intersections. Therefore, an operational deficiency occurs when the project causes an unsatisfactory condition (deterioration from LOS A through D to E or F) for intersections or when the project contributes to an existing or forecast deficiency. The project needs to identify improvements to improve the intersection LOS to an acceptable level.

Although LOS cannot be used as a CEQA metric to identify significant transportation impacts, intersection operations were analyzed for the proposed Project and are discussed in section 3.13.8, Impact Analysis.

3.13.3 EXISTING CONDITIONS

This subsection presents the existing bicycle, pedestrian, and transit facilities as well as intersection operations under Existing Conditions.

EXISTING PEDESTRIAN AND BICYCLE FACILITIES

The vision of the City of Clovis Active Transportation Plan (ATP), updated January 2022, is a "City with a complete and connected network of trails, walkways, and bikeways that provides convenient and intuitive connections to key destinations and supports travel within and between neighborhoods. The network improves quality of life by encouraging walking and bicycling for transportation and recreation." The ATP identifies different strategies to improve safety and accessibility for active modes of transportation such as walking and biking. There are four different types of bicycle facilities in the City:

1. Class I Bikeway: Trails
2. Class II Bikeway: Bicycle Lanes
3. Class II Bikeway: Buffered Bicycle Lanes
4. Class III Bikeway: Bicycle Routes

One of the long-term visions of the City includes upgrading existing or recommended Class II Bicycle Lanes and Buffered Bicycle Lanes to Class IV Separated Bicycle Lanes.

Figures 3.13-2 and 3.13-3 illustrate the existing and proposed bicycle facilities within the City. At present, Class II bicycle lanes exist along Clovis Avenue, Willow Avenue, and some segments of Shepherd Avenue and Fowler Avenue within the Study Area. However, as shown in Figure 3.13-3, different bicycle facilities are proposed along other roadways within the Study Area, such as Sunnyside Avenue, Teague Avenue, Nees Avenue, and Alluvial Avenue.

PEDESTRIAN

The City has an extensive pedestrian network, with sidewalks along most of the major roads. However, since a portion of the Study Area falls within recently incorporated areas of the City, sidewalks are not present because they were previously developed as per unincorporated Fresno County design guidelines. Figure 3.13-4 illustrates the existing sidewalk facilities within the City of Clovis.

The City's ATP has identified improvements to the pedestrian network based on a citywide sidewalk network gap analysis. Additionally, several potential locations have been identified to install mid-block crossings to improve trail connectivity throughout Clovis. Two trails (i.e., the Dry Creek Trail and the Enterprise Trail) currently exist within the Study Area. However, additional trails are being proposed in the Study Area with potential mid-block crossings.

TRANSIT SERVICE

Clovis Transit Stageline Routes 10 and 80 operate within the Study Area. Route 10 operates from Monday through Saturday, while Route 80 operates only on school days, based on the Clovis Unified School District schedule. Route 10 provide access to Fresno State University and Route 80 provides access to the Buchanan Education Complex. Fresno Area Express (FAX) operates within the Study Area along Willow Avenue 7 days a week. The route connects communities in Fresno to the different campuses of Clovis Community College. In addition to fixed route services, Round Up is the Clovis paratransit service for disabled City residents. Round Up transit vehicles are all accessible in accordance with the Americans with Disabilities Act (ADA) standards.

EXISTING INTERSECTION OPERATIONS

An intersection LOS analysis was conducted for Existing Conditions using the methodologies previously discussed. Existing Signal timing Sheets were obtained from the City and Caltrans for all signalized analysis intersections. The signal timing sheets are included in Appendix C of the

Transportation Impact Report (Appendix I of this EIR). It should be noted that the existing signal timings were utilized to analyze traffic operations under near-term and cumulative (2046) scenarios as a conservative approach. Table 8-A summarizes the results of this analysis and shows that the following intersections operate at an unsatisfactory LOS under existing conditions:

- Minnewawa Avenue/Behymer Avenue (a.m. peak hour only)
- Fowler Avenue/Shepherd Avenue (a.m. peak hour only)
- Fowler Avenue/State Route 168 Eastbound Ramps (p.m. peak hour only)

All other study intersections operate at a satisfactory LOS under existing conditions.

A roadway segment LOS analysis was conducted for Existing Conditions using the methodologies previously discussed. Table 8-B summarizes the results of this analysis and shows that all the study roadway segments currently operate at a satisfactory LOS under existing conditions.

Technical calculations are displayed in Appendix E of the Transportation Analysis Report prepared by LSA for the proposed Project (contained within Appendix I of this EIR).

3.13.4 EXISTING PLUS PROJECT CONDITIONS

PROJECT TRIP GENERATION

The trip generation for the proposed Project was developed using rates from the *Trip Generation Manual 11th Edition* (Institute of Transportation Engineers, 2021) for Land Use 210 – "Single-Family Detached Housing." Table 3.13-3 summarizes the project trip generation. As shown in Table 6-A, the Project is anticipated to generate 424 trips in the a.m. peak hour, 569 trips in the p.m. peak hour, and 5,705 daily trips.

TABLE 3.13-3: PROJECT TRIP GENERATION

LAND USE	*UNITS*	*AM PEAK HOUR*			*PM PEAK HOUR*		
		IN	*OUT*	*TOTAL*	*IN*	*OUT*	*TOTAL*
Single-Family Residential Detached Housing (ITE 210)	605 DU	109	315	424	357	212	569

NOTES: TRIP GENERATION IS BASED ON TRIP RATES PUBLISHED IN TRIP GENERATION MANUAL 11TH EDITION (INSTITUTE OF TRANSPORTATION ENGINEERS, 2021).
SOURCE: LSA, 2023

PROJECT TRIP DISTRIBUTION

The Project trip distribution was developed using select zone model runs obtained from the Fresno COG ABM. Appendix A of Transportation Impact Report (Appendix I of this EIR) includes the select zone model plots for the proposed Project. Figure 3.14-5 illustrates the Project trip distribution. The Project trip generation was applied to the corresponding trip distribution pattern to develop the Project trip assignment. Figure 3.14-6 illustrates the Project trip assignment.

EXISTING PLUS PROJECT INTERSECTION OPERATIONS

Analysis of the existing with Project scenario is provided to identify direct Project-related operational deficiency if the Project were to be built and in operation today. This scenario eliminates the effects of ambient growth and other cumulative projects and deals specifically with operational deficiencies only due to the Project traffic. Figure 3.13-7 illustrates the study intersection geometrics and traffic control under all 'plus Project' scenarios.

An intersection LOS analysis was conducted for Existing Plus Project Conditions using the methodologies previously discussed. The following intersections are forecasted to operate at an unsatisfactory LOS under Existing Plus Project conditions:

- Minnewawa Avenue/Behymer Avenue (a.m. peak hour only)
- Sunnyside Avenue/Shepherd Avenue (p.m. peak hour only)
- Sunnyside Avenue/Nees Avenue (p.m. peak hour only)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/State Route 168 Eastbound Ramps (p.m. peak hour only)

Based on the operational deficiency criteria stated in Section 3.2 of this TIA, the Project is forecasted to create an operational deficiency at these intersections. All other study intersections are forecasted to operate at a satisfactory LOS under Existing Plus Project conditions.

It should be noted that out of the five intersections forecasted to operate at a deficient LOS, three intersections are currently operating at a deficient LOS. As such, the Project is forecast to add to the existing deficiencies at these intersections.

A roadway segment LOS analysis was conducted for Existing Plus Project Conditions using the methodologies previously discussed. Table 8-B summarizes the results of this analysis and shows that all study roadway segments are forecasted to operate at a satisfactory LOS under Existing Plus Project conditions.

3.13.5 NEAR-TERM CUMULATIVE (2028) CONDITIONS ANALYSIS

A Near-Term Cumulative Conditions analysis was performed to identify potential impacts of the Project under Cumulative AM and PM peak hour conditions. The analysis reflects near-term development in the City of Clovis and other nearby jurisdictions.

NEAR-TERM PLUS PROJECT INTERSECTION OPERATIONS

An intersection LOS analysis was conducted for Near-term Plus Project conditions using the methodologies previously discussed. The following intersections are forecasted to operate at an unsatisfactory LOS under near-term plus project conditions:

- Minnewawa Avenue/Behymer Avenue (a.m. peak hour only)

- Minnewawa Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Shepherd Avenue (p.m. peak hour only)
- Clovis Avenue/Nees Avenue (p.m. peak hour only)
- Clovis Avenue/Herndon Avenue (p.m. peak hour only)
- Sunnyside Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/SR-168 Eastbound Ramps (p.m. peak hour only)

Based on the operational deficiency criteria stated in Section 3.2 of the Transportation Impact Report (as provided in Appendix I of this EIR), the Project is forecasted to create an operational deficiency at these intersections. All other study intersections are forecasted to operate at a satisfactory LOS under Near-Term Plus Project conditions.

3.13.6 CUMULATIVE (2046) CONDITIONS ANALYSIS

A Cumulative Conditions analysis was performed to identify potential impacts of the Project under Cumulative AM and PM peak hour conditions. The analysis reflects long-term development in the City of Clovis and other nearby jurisdictions.

CUMULATIVE NO PROJECT INTERSECTION OPERATIONS

An intersection LOS analysis was conducted for Cumulative Without Project conditions using the methodologies previously discussed. The following intersections are forecasted to operate at an unsatisfactory LOS under Cumulative Without Project conditions:

- Willow Avenue/Shepherd Avenue (p.m. peak hour only)
- Minnewawa Avenue/Behymer Avenue (a.m. and p.m. peak hours)
- Minnewawa Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Shepherd Avenue (p.m. peak hour only)
- Clovis Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Herndon Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Teague Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/SR-168 Eastbound Ramps (p.m. peak hour only).

All other study intersections are forecasted to operate at a satisfactory LOS under Cumulative (2046) Without Project conditions.

A roadway segment LOS analysis was conducted for cumulative without project conditions using the methodologies previously discussed. Table 8-F summarizes the results of this analysis and shows that the following roadway segments are forecast to operate at an unsatisfactory LOS under Cumulative Without Project conditions:

- Behymer Avenue, between Minnewawa Avenue and Sunnyside Avenue (a.m. peak hour only)
- Shepherd Avenue, between Willow Avenue and Minnewawa Avenue (p.m. peak hour only)
- Shepherd Avenue, between Clovis Avenue and Sunnyside Avenue (p.m. peak hour only)
- Minnewawa Avenue, between Behymer Avenue and Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue, between Shepherd Avenue and Project Driveway 1 (a.m. and p.m. peak hours)
- Fowler Avenue, between Ticonderoga and Shepherd Avenue (a.m. and p.m. peak hours).

All other roadway segments are forecasted to operate at a satisfactory LOS under cumulative without project conditions.

CUMULATIVE PLUS PROJECT INTERSECTION OPERATIONS

An intersection LOS analysis was conducted for Cumulative Plus Project Conditions using the methodologies previously discussed. The following intersection is forecasted to operate at an unsatisfactory LOS under Cumulative Plus Project Conditions:

- Willow Avenue/Shepherd Avenue (p.m. peak hour only)
- Minnewawa Avenue/Behymer Avenue (a.m. and p.m. peak hours)
- Minnewawa Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Shepherd Avenue (p.m. peak hour only)
- Clovis Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Alluvial Avenue (a.m. peak hour only)
- Clovis Avenue/Herndon Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Teague Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/SR-168 Eastbound Ramps (p.m. peak hour only)
- Sunnyside Avenue/Project Driveway 1 (a.m. and p.m. peak hours)
- Sunnyside Avenue/Project Driveway 2 (a.m. and p.m. peak hours)

Based on the operational deficiency criteria, the Project is forecasted to create an operational deficiency at these intersections. All other study intersections are forecasted to operate at a satisfactory LOS under cumulative plus project conditions. It should be noted that out of the 14 intersections forecast to operate at a deficient LOS, 11 intersections forecast to operate at a deficient LOS under cumulative (2046) without project conditions. As such, the project is forecast to add to the forecasted deficiencies at these 11 intersections. Detailed intersection LOS worksheets are included in Appendix I.

A roadway segment LOS analysis was conducted for cumulative plus project conditions using the methodologies previously discussed. Table 8-F summarizes the results of this analysis and shows that the following roadway segments are forecast to operate at an unsatisfactory LOS under Cumulative Plus Project Conditions:

- Behymer Avenue, between Minnewawa Avenue and Sunnyside Avenue (a.m. peak hour only)
- Shepherd Avenue, between Willow Avenue and Minnewawa Avenue (p.m. peak hour only)
- Shepherd Avenue, between Clovis Avenue and Sunnyside Avenue (a.m. and p.m. peak hours)
- Shepherd Avenue, between Sunnyside Avenue and Project Driveway 3 (p.m. peak hour only)
- Minnewawa Avenue, between Behymer Avenue and Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue, between Shepherd Avenue and Project Driveway 1 (a.m. and p.m. peak hours)
- Fowler Avenue, between Ticonderoga and Shepherd Avenue (a.m. and p.m. peak hours)

Based on the operational deficiency criteria, the Project is forecasted to create an operational deficiency at these roadway segments. All other roadway segments are forecasted to operate at a satisfactory LOS under Cumulative Plus Project Conditions. It should be noted that out of the seven roadway segments forecast to operate at a deficient LOS, six segments are forecast to operate at a deficient LOS under Cumulative (2046) Without Project Conditions. As such, the Project is forecast to add to the forecasted deficiencies at these six roadway segments.

3.13.7 REGULATORY SETTING

Existing transportation polices, laws, and regulations that would apply to the proposed Project are summarized below. This information provides a context for the impact discussion related to the Project's consistency with applicable regulatory conditions and development of significance criteria for evaluating Project impacts.

STATE

Senate Bill 743

Senate Bill (SB) 743 was signed into law in 2013 and is leading to substantial changes in the way transportation impact analyses are being prepared. Notably, it precludes the use of level of service (LOS) to identify significant transportation impacts in CEQA documents for land use projects, recommending instead that VMT be used as the preferred metric. On December 28, 2018, the CEQA Guidelines were amended to add Section 15064.3, Determining the Significance of Transportation

Impacts, which states that generally, VMT is the most appropriate measure of transportation impacts. According to 15064.3(a), "Except as provided in subdivision (b)(2) (regarding roadway capacity), a project's effect on automobile delay shall not constitute a significant environmental impact." Beginning on July 1, 2020, the provisions of 15064.3 applied statewide.

To aid in SB 743 implementation, OPR released a *Technical Advisory on Evaluating Transportation Impacts in CEQA* (Technical Advisory) in December 2018. The Technical Advisory provides advice and recommendations to CEQA lead agencies on how to implement the SB 743 changes. This includes technical recommendations regarding the assessment of VMT, thresholds of significance, VMT mitigation measures, and screening thresholds for certain land use projects. Lead agencies may consider and use these recommendations at their discretion and with the provision of substantial evidence to support alternative approaches.

The Technical Advisory identifies "screening thresholds" to quickly identify when a project should be expected to cause a less-than-significant impact without conducting a detailed study. The Technical Advisory suggests that projects meeting one or more of the following criteria should be expected to have a less-than-significant impact on VMT:

1. **Small projects** – projects consistent with a SCS and local general plan that generate or attract fewer than 110 trips per day.

2. **Projects near major transit stops** – certain projects (residential, retail, office, or a mix of these uses) proposed within ½ mile of an existing major transit stop or an existing stop along a high-quality transit corridor.

3. **Affordable residential development** – a project consisting of a high percentage of affordable housing may be a basis to find a less-than-significant impact on VMT.

4. **Local-serving retail** – local-serving retail development tends to shorten trips and reduce VMT. The Technical Advisory encourages lead agencies to decide when a project will likely be local-serving, but generally acknowledges that retail development including stores larger than 50,000 square feet might be considered regional-serving. The Technical Advisory suggests lead agencies analyze whether regional-serving retail would increase or decrease VMT (i.e., not presume a less-than-significant).

5. **Projects in low VMT areas** – residential and office projects that incorporate similar features (i.e., density, mix of uses, transit accessibility) as existing development in areas with low VMT will tend to exhibit similarly low VMT.

The Technical Advisory also identifies recommended numeric VMT thresholds for residential, office, and retail projects. The residential threshold is described below.

1. Residential development that would generate vehicle travel exceeding 13 percent below existing (baseline) residential VMT per capita may indicate a significant transportation impact. Existing VMT per capita may be measured as a regional VMT per capita or as city VMT per capita.

LEVEL OF SERVICE (LOS)

As previously noted, LOS may no longer be used to identify significant transportation impacts in CEQA documents for land use projects. However, this analysis includes a LOS analysis to determine if the proposed Project would result in deficient intersection operations per the City of Clovis standards. Policy 2.1 of the General Plan strives for LOS D or better.

LOCAL

City of Clovis General Plan

The City of Clovis General Plan includes several policies that are relevant to an evaluation of the visual quality of the Project site. The policies applicable to the Project are identified below:

POLICIES: CIRCULATION ELEMENT

1. Policy 1.1. Multimodal network. The city shall plan, design, operate, and maintain the transportation network to promote safe and convenient travel for all users: pedestrians, bicyclists, transit riders, freight, and motorists.
2. Policy 1.2. Transportation decisions. Decisions should balance the comfort, convenience, and safety of pedestrians, bicyclists, and motorists.
3. Policy 1.3. Age and mobility. The design of roadways shall consider all potential users, including children, seniors, and persons with disabilities.
4. Policy 1.4. Jobs and housing. Encourage infill development that would provide jobs and services closer to housing, and vice versa, to reduce citywide vehicle miles travelled and effectively utilize the existing transportation infrastructure.
5. Policy 1.5. Neighborhood connectivity. The transportation network shall provide multimodal access between neighborhoods and neighborhood-serving uses (educational, recreational, or neighborhood commercial uses).
6. Policy 1.6. Internal circulation. New development shall utilize a grid or modified-grid street pattern. Areas designated for residential and mixed-use village developments should feature short block lengths of 200 to 600 feet.
7. Policy 1.7. Narrow streets. The City may permit curb-to-curb dimensions that are narrower than current standards on local streets to promote pedestrian and bicycle connectivity and enhance safety.
8. Policy 2.1. Level of service. The following is the City's level of service (LOS) standards:
    A. Achieve LOS D vehicle traffic operations during the a.m. and p.m. peak hours.
    B. Allow exceptions on a case-by-case basis where lower levels of service would result in other public benefits, such as:
        i. Preserving agriculture or open space land;
        ii. Preserving the rural/historic character of a neighborhood;
        iii. Preserving or creating a pedestrian-friendly environment in Old Town or mixed-use village districts;
        iv. Avoiding adverse impacts to pedestrians, cyclists, and mass transit riders;

v. Where right-of-way constraints would make capacity expansion infeasible.

9. Policy 2.2. Fair share costs. New development shall pay its fair share of the cost for circulation improvements in accordance with the city's traffic fee mitigation program.
10. Policy 2.3. Right-of-way dedication. The city may require right-of-way dedication essential to the circulation system in conjunction with any development or annexation. The City shall request the County of Fresno to apply the same requirements in the Clovis planning area.
11. Policy 3.1. Traffic calming. Employ traffic-calming measures in new developments and existing neighborhoods to control traffic speeds and maintain safety.
12. Policy 3.4. Road diets. Minimize roadway width as feasible to serve adjacent neighborhoods while maintaining sufficient space for public safety services.
13. Policy 3.5. Roadway widening. Only consider street widening or intersection expansions after considering multimodal alternative improvements to non-automotive facilities.
14. Policy 3.6. Soundwalls. Design roadway networks to disperse traffic to minimize traffic levels. Discourage soundwalls along new collector and local streets when feasible.
15. Policy 3.7. Conflict points. Minimize the number of and enhance safety at vehicular, pedestrian, and bicycle conflict points.
16. Policy 3.8. Access management. Minimize access points and curb cuts along arterials and prohibit them within 200 feet of an intersection where possible. Eliminate and/or consolidate driveways when new development occurs or when traffic operation or safety warrants.
17. Policy 3.9. Park-once. Encourage "park-once" designs where convenient, centralized public parking areas are accompanied by safe, visible, and well-marked access to sidewalks and businesses.
18. Policy 3.10. Pedestrian access and circulation. Entrances at signalized intersections should provide sidewalks on both sides of the entrance that connect to an internal pedestrian pathway to businesses and throughout nonresidential parking lots larger than 50 spaces.
19. Policy 3.11. Right-of-way design. Design landscaped parkways, medians, and right-of-ways as aesthetic buffers to improve the community's appearance and encourage non-motorized transportation.
20. Policy 3.12. Residential orientation. Where feasible, residential development should face local and collector streets to increase visibility and safety of travelers along the streets and encourage pedestrian and bicycle access.
21. Policy 5.2. Development-funded facilities. Require development to fund and construct facilities as shown in the Bicycle Transportation Plan when facilities are in or adjacent to the development.
22. Policy 5.3. Pathways. Encourage pathways and other pedestrian amenities in Urban Centers and new development 10 acres or larger.
23. Policy 5.4. Homeowner associations. The city may require homeowner associations to maintain pathways and other bicycle and pedestrian facilities within the homeowner association area.
24. Policy 5.5. Pedestrian access. Require sidewalks, paths, and crosswalks to provide access to schools, parks, and other activity.

City of Clovis Active Transportation Plan

The Clovis Active Transportation Plan is a comprehensive guide that supports walking, bicycling, transit, and use of other emerging modes of personal transport as alternatives to driving within Clovis, to neighboring cities, and regional destinations. The Plan identifies strategies to improve safety and accessibility for active forms of travel such as walking and bicycling and proposes a framework for implementing projects, programs, and policies.

Fresno County Regional Transportation Plan

Fresno Council of Government's (Fresno COG's) 2022 Regional Transportation Plan (RTP) comprehensively assesses all forms of transportation available in Fresno County as well as travel and goods movement needs through 2046.

Fresno County Regional Traffic Impact Fee

The Regional Transportation Impact Fee (RTIF) is a county-wide, multi-jurisdiction capital improvement funding program intended to cover a portion of the costs for new transportation facilities required to serve new development within the County.

3.13.8 THRESHOLDS OF SIGNIFICANCE

This section describes the thresholds or criteria that determine whether the Project causes a significant impact on the roadway, bicycle, pedestrian, rail, and/or transit systems. These thresholds are based on California Environmental Quality Act (CEQA), policies from the General Plans for the City of Clovis and Fresno County, and Caltrans policies. For the purposes of this Draft EIR, the Project would cause a significant impact if it would result in any of the following listed criteria:

1. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities;
2. Conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b);
3. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment); and/or
4. Result in inadequate emergency access.

Appendix G of the CEQA Guidelines indicates that impacts may be significant if a project conflicts with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. The proposed Project would have a significant impact on transit, bicycles, or pedestrians if it would conflict with adopted policies, plans, or programs regarding these systems, or create or exacerbate disruptions to the performance or safety of these systems.

Appendix G of the CEQA Guidelines indicates that impacts may be significant if a project would substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). Impacts may also be significant if a project results in inadequate emergency access. The proposed Project would have a significant impact on the transportation system if it would increase hazards due to a design feature, incompatible uses, or inadequate emergency access.

The existing General Plan includes a policy within the Transportation Element which requires maintenance of a level of service (LOS) D standard on City roadways, with some exceptions. Because LOS is no longer a CEQA significance metric, an analysis of LOS is provided for the purposes of policy consistency analysis.

3.13.9 IMPACTS AND MITIGATION MEASURES

Impact 3.13-1: Project implementation would not result in VMT increases that are greater than 87 percent of Baseline conditions. (Significant and Unavoidable)

The proposed development was evaluated against the screening criteria in OPR's Technical Advisory. The following criteria is applicable to residential developments.

1. Small projects – projects consistent with a Sustainable Communities Strategy and local general plan that generate or attract fewer than 110 trips per day.
2. Projects near major transit stops – certain projects (residential, retail, office, or a mix of these uses) proposed within ½ mile of an existing major transit stop or an existing stop along a high-quality transit corridor.
3. Affordable residential development – a project consisting of a high percentage of affordable housing may be a basis to find a less-than-significant impact on VMT.
4. Projects in low VMT areas – residential and office projects that incorporate similar features (i.e., density, mix of uses, transit accessibility) as existing development in areas with low VMT will tend to exhibit similarly low VMT.

The SB 743 Memorandum identifies the recommended numeric VMT thresholds for residential projects. Based on the VMT thresholds, a residential project would result in a less-than-significant transportation impact if:

5. Under existing (baseline) conditions, the residential development would generate home-based VMT per dwelling unit equal or below 87 percent of the existing (baseline) City of Clovis average for the same housing category (single family, multi-family, or age-restricted); and
6. Under cumulative conditions, the residential development would generate home-based VMT per dwelling equal or below 87 percent of the cumulative City of Clovis average for the same housing category (single family, multi-family, or age-restricted).

Alternatively, the project would result in a less-than-significant transportation impact if:

7. The residential development would cause the total VMT in the model area to decrease under baseline AND cumulative conditions.

The proposed development does not constitute a small project, is not located within ½ mile of an existing major transit stop and is not a redevelopment project. Therefore, the development is not eligible to be screened out based on these criteria.

A detailed VMT analysis was conducted using methodology discussed in Appendix I of this EIR. The proposed residential development would result in a significant transportation impact if it would 1). generate vehicle travel exceeding 87 percent of the established baseline VMT under existing (baseline) or cumulative conditions, or 2). result in an increase in total VMT in the model area.

Table 3.13-5 summarizes the regional threshold and Project VMT per capita. As shown in Table 3.13-5, the Project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Therefore, based on the TIA Guidelines, the project will have a significant VMT impact.

TABLE 3.13-2: EXISTING (2019) REGIONAL AND PROJECT VMT PER CAPITA

REGION (FRESNO COUNTY)[1]	*PROJECT*	*DIFFERENCE*	*PERCENTAGE DIFFERENCE*
14.1	17.0	2.9	20.7%

SOURCE: FRESNO COUNCIL OF GOVERNMENTS' ACTIVITY-BASED MODE

When a lead agency identifies a significant CEQA impact, the agency must identify feasible mitigation measures in order to avoid or substantially reduce that impact. VMT impacts can be mitigated through more behavioral changes. Enforcement of mitigation measures will be subject to the mitigation monitoring requirements under CEQA, as well as the regular police powers of the agency. These measures can also be incorporated as a part of plans, policies, regulations, or project designs. Project design features that encourage mode shift from automobiles to transit or non-motorized modes can therefore help reduce Project VMT as well. Typically, VMT reduction and benefits from these Project design features are not accounted in the Project VMT calculations conducted using the regional travel demand model. Therefore, VMT reduction credit can be accounted for these design features similar to VMT mitigation measures to help reduce the Project's VMT impact.

Evaluation of VMT reductions should be evaluated using state-of-the-practice methodologies recognizing that many of the VMT mitigation strategies/project design features are dependent on building tenant performance over time. Following is a detailed description of both and the corresponding potential reduction that could be achieved with implementation of these measures.

PROJECT DESIGN FEATURES AND MITIGATION MEASURES

VMT reduction that can be achieved by the Project design features have been estimated using the most California Air Pollution Control Officers Association's (CAPCOA) "*Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity – Designed for Local Governments, Communities, and Project Developers*" dated December 2021. As per information provided by the Project Description, the Project intends to implement the following Project design features that will help reduce Project VMT.

- **Pedestrian Infrastructure:** The Project proposes to provide pedestrian improvements/sidewalks both internal to the Project site and along the Project frontage. Providing sidewalk/pedestrian improvements encourage people to walk instead of drive and thus reduces VMT. CAPCOA transportation measure **T-18: Provide Pedestrian Network Improvement** was used to estimate the VMT reduction due to Project related enhancements in pedestrian access and connectivity. The CAPCOA methodology requires existing sidewalk length in the Project study area in addition to the length of sidewalk being provided by the Project. In order to estimate the existing sidewalk length, a survey was conducted along the proposed Project frontage. Based on the survey, the Project study area includes approximately 10 miles of sidewalk. The Project proposes to add approximately another 2.3 miles of sidewalk/pedestrian access. Therefore, this measure may reduce the Project's VMT by approximately 1.17 percent.
- **Improve Street Connectivity:** The Project proposes to provide an internal circulation network. Projects with higher density of intersections would help increase street connectivity, reduce trip lengths, and promote use of alternative transportation modes of travel. CAPCOA handbook, identifies measure **T-17: Improve Street Connectivity** to evaluate Project street network. The measure is recommended as an appropriate design feature for plans within urban or suburban areas. The Project is located in suburban/rural area type setting, so this measure was explored as a potential VMT reduction design feature.

  Measure T-17 estimates that an increased density of vehicular intersections improves street connectivity and helps in reduction in GHG emissions and corresponding VMT. As included in the CAPCOA handbook, this measure could be applied to a project for:

  > *'Projects that increase intersection density would be building a new street network in a subdivision or retrofitting an existing street network to improve connectivity (e.g., converting cul-de-sacs or dead-end streets to grid streets)'.*

  The measure establishes the following numerical formula of VMT reduction due to increased intersection density and improved street connectivity:

  $$A = \frac{B - C}{C} * D$$

  Where,
  A = Percent Reduction in GHG/VMT emission from vehicle Travel
  B = Intersection Density in project site with measure

C = Average Intersection Density for Typical developments (36)
D = Elasticity of VMT with respect to intersection density (-0.14)

The CAPCOA handbook establishes the variable C using an average density of intersections within a square mile in a typical development as included in the Proposed Trip Generation, Distribution, and Transit Mode Split Forecasts for the Bayview Waterfront Project Transportation Study, Fehr & Peers. 2009. This establishes the average suburban intersection density for the entire United States.

The CAPCOA handbook adapts the variable D, Elasticity of VMT with respect to intersection density from the report ‘Does Compact Development Make People Drive Less?’ published in the Journal of the American Planning Association, 2016, authored by Mark R. Stevens. The elasticity was determined from a meta-regression analysis from data of fifteen studies, having studied in different urban/suburban geographic regions within the Country.

While the increased intersection density helps facilitate greater number of short trips, the project consists of only single land use type (residential) and the amount of internal capture (trips that can be fulfilled within the project; with both origin and destinations within the project site) would be minimal. Also, CAPCOA suggests application of different VMT mitigation measures at different scales – project/site scale or community/plan scale. Based on CAPCOA handbook, this measure is applicable at a plan/community scale. However, this measure was explored as a VMT reduction design feature at a project scale with appropriate limitations as described below.

While all the internal intersections can be considered to estimate the VMT reduction due to increased street connectivity, given the above limitations (project location area type, single land use type, and CAPCOA applicability scale), only project driveways were reviewed for applicability for this measure. As indicated in section “1.1 – Project Description,” the Project has four driveways (two on Sunnyside Avenue, one of Perrin Road, and one on Shepherd Avenue) for Project access. Except for the driveway on Shepherd Avenue, all other Project driveways will operate as full-access driveways. The driveway on Shepherd Avenue will operate as a Right-In Right-Out Left-In (RIROLI) driveway. However, all 4 Project driveways were considered as Project intersections for the mitigation purposes. The proposed Project site is approximately 77 acres. Therefore, the intersection density of the Project would be approximately 33.25 intersections per square mile.

Since Project intersection density is lower than the countrywide average intersection density of 36 intersections per square mile as identified in the CAPCOA handbook, no direct VMT reduction has been accounted for this Project design feature.

- **Bicycle Infrastructure/Improvements:** The Project proposes to provide 8-feet wide bike lanes (Class II Bike Lane) on Shepherd Avenue and N. Sunnyside Avenue. Additionally, the Project will install a 12-foot trail (Class I Bike Path) adjacent to the Project along Shepherd Avenue. The Project proposes to construct a total of 0.67 miles of bike lanes along Shepherd Avenue and Sunnyside Avenue. Similar to pedestrian facilities, these bicycle design features included in the Project can encourage increase active transportation mode share in the area. The CAPCOA manual was utilized to estimate the reduction of Project VMT due to proposed bicycle improvements. Specifically, CAPCOA transportation measure "T-19A: Construct or Improve Bike Facility" was deemed applicable to estimate the VMT reduction due to Project bicycle features. According to the measure, providing bicycle infrastructure helps to improve biking conditions within an area. This encourages a mode shift on the roadway parallel to the bicycle facility from vehicles to bicycles, displacing VMT and thus reducing GHG emissions. Based on CAPCOA estimates, the Project bicycle design features have a potential to reduce up to 0.01 percent of the Project VMT.

- **Provide Electric Vehicle (EV) Parking and EV Charging Infrastructure:** Accessible EV parking and provision of charging for electric vehicles in the residential units will encourage the use of EVs. The latest California Green Building Standards (CALGreen), California Building Code, requires provision of infrastructure to accommodate electric vehicle chargers for new single-family and attached dwelling units/town houses. For new construction projects such as apartments, condos, hotels, and motels, CALGreen code requires the project to provide EV charging stations as a percentage of the total Project parking. While it is understood that provision of electric charging infrastructure/stations might not reduce VMT, it will reduce GHG, which can be considered equivalent to reduction in VMT. According to CAPCOA, provision of additional electric charging stations, in addition to CALGreen requirements, can be considered as a GHG/VMT mitigation. Provision of EV charging infrastructure has a potential to achieve a maximum VMT reduction of up to 11.9 percent. However, the Project is a single-family residential development and as such, doesn't propose to provide electric charging stations beyond the CALGreen code requirements. Additionally, there is no guarantee that residents would be using electric vehicles even if charging stations are available. As such, while this Project design feature has the potential to reduce GHG emissions, no direct VMT reduction has been accounted for this Project design feature.

Table 2-B in the Transportation Impact Report (Appendix I of this EIR) provides methodology, assumptions, and parameters used in the estimation/calculation of VMT reduction for the Project along with the potential amount of VMT reduction that can be achieved.

In conclusion, Project design features aim to promote overall mobility with the goal of reducing VMT and reducing greenhouse gas emissions. Implementation of these Project design features may possibly reduce the Project's VMT by approximately up to 1.18 percent. A combination of measures from several VMT reduction strategies were incorporated into the Project design to achieve this VMT reduction as outlined above. This included strategies that are aimed at reducing the number of automobile trips generated by the Project, shift more trips from automobile to non-automobile modes, and/or reduce the distances that people drive. Ultimately, however, the City of Clovis is a suburban community with land use characteristics that are more spread out when compared to dense urban communities. The land use and transportation characteristics of suburban communities such as Clovis, can make it difficult, or impossible to achieve VMT reductions to levels that the City has established as a goal, and ultimately, as a threshold of significance for CEQA analysis. The Project design features are estimated to offset some of the VMT impacts of the Project by reducing VMT by up to 1.18 percent, but this reduction will not reduce the impact to a less than significant level. Therefore, the Project will have a **significant and unavoidable** relative to this topic.

Impact 3.13-2: Project implementation may conflict with a program, plan, policy or ordinance addressing the circulation system, including transit, bicycle, and pedestrian facilities. (Less than Significant)

The City of Clovis ATP (2022) and City of Clovis General Plan (2014) were reviewed to determine if the proposed Project results in any inconsistencies with adopted transportation related policies.

ACTIVE TRANSPORTATION PLAN (ATP)

At the present, Class II bicycle lanes exist along Clovis Avenue, Willow Avenue, and some segments of Shepherd Avenue and Fowler Avenue within the vicinity of the Project Site. Furthermore, two pedestrian trails (i.e., the Dry Creek Trail and the Enterprise Trail) currently exist within the vicinity of the Project site. However, additional trails are being proposed in the vicinity of the Project site with potential mid-block crossings.

The proposed Project will also construct sidewalks on internal streets, providing adequate connections to and throughout the site for pedestrians. As mentioned before, the Project proposes to provide pedestrian improvements/sidewalks both internal to the Project site and along the Project frontage. The Project proposes to provide 8-feet wide bike lanes (Class II Bike Lane) on Shepherd Avenue and N. Sunnyside Avenue. Additionally, the Project will install a 12-foot trail (Class II Bike Path) adjacent to the Project along Shepherd Avenue. The Project proposes to construct a total of 0.67 miles of bike lanes along Shepherd Avenue and Sunnyside Avenue.

CITY OF CLOVIS GENERAL PLAN

It is noted that the proposed Project will require a General Plan Land Use Amendment to adjust the land uses from Rural Residential (RR) to Medium High Density (MH) for the Development Area to accommodate the proposed development density.

Additionally, the proposed Project is consistent with policies identified in the Circulation Element of the City of Clovis General Plan, as described below:

Policies: Circulation Element

1. Policy 2.1. Level of service. The following is the City's level of service (LOS) standards:
   - A. Achieve LOS D vehicle traffic operations during the a.m. and p.m. peak hours.
   - B. Allow exceptions on a case-by-case basis where lower levels of service would result in other public benefits, such as:
     - i. Preserving agriculture or open space land;
     - ii. Preserving the rural/historic character of a neighborhood;
     - iii. Preserving or creating a pedestrian-friendly environment in Old Town or mixed-use village districts;
     - iv. Avoiding adverse impacts to pedestrians, cyclists, and mass transit riders;
     - v. Where right-of-way constraints would make capacity expansion infeasible.
2. Policy 1.6. Internal circulation. New development shall utilize a grid or modified-grid street pattern. Areas designated for residential and mixed-use village developments should feature short block lengths of 200 to 600 feet.
3. Policy 2.2. Fair share costs. New development shall pay its fair share of the cost for circulation improvements in accordance with the city's traffic fee mitigation program.
4. Policy 3.6. Soundwalls. Design roadway networks to disperse traffic to minimize traffic levels. Discourage soundwalls along new collector and local streets when feasible.
5. Policy 3.10. Pedestrian access and circulation. Entrances at signalized intersections should provide sidewalks on both sides of the entrance that connect to an internal pedestrian pathway to businesses and throughout nonresidential parking lots larger than 50 spaces.
6. Policy 3.12. Residential orientation. Where feasible, residential development should face local and collector streets to increase visibility and safety of travelers along the streets and encourage pedestrian and bicycle access.
7. Policy 5.2. Development-funded facilities. Require development to fund and construct facilities as shown in the Bicycle Transportation Plan when facilities are in or adjacent to the development.
8. Policy 5.5. Pedestrian access. Require sidewalks, paths, and crosswalks to provide access to schools, parks, and other activity.

As mentioned before, an analysis of the study intersections and roadway segments was performed to determine LOS as a result of Project implementation. Results of this analysis and shows that all intersections and roadway segments are forecast to operate at a satisfactory LOS under Near-Term (2028) Plus Project conditions with the exception of 10 intersections and 3 roadway segments; And all intersections and roadway segments are forecast to operate at a satisfactory LOS under Cumulative (2046) Plus Project Conditions with the exception of 15 intersections and 10 roadway segments.

Although LOS cannot be used as a CEQA metric to identify significant transportation impacts, intersection operations were analyzed for the proposed Project and are discussed in Chapters 8 and 9 of the Transportation Impact Analysis, included in Appendix I of this EIR. Improvements have been recommended at study intersections and roadway segments where an operational deficiency has been identified based on the results of the LOS analysis. It should be noted that as shown in Tables 8-A, 8-C, and 8-E of the Traffic Impact Analysis, the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, as shown in Tables 10-B and 10-C of the Traffic Impact Analysis, both the ramp intersections are projected to have queuing deficiencies under future conditions (near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. As shown in Tables 9-C, and 9-D of the Traffic Impact Analysis, the intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under near-term, and cumulative scenarios with implementation of this improvement. Further, as shown in Tables 10-E and 10-F of the Traffic Impact Analysis, and discussed in chapter 10.0 of this report, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Table 9-E of Appendix E of the Transportation Impact Report (Appendix I of this EIR) summarizes the recommended improvements for roadway segments for all analysis scenarios. Tables 9-F and 9-G of the Transportation Impact Report (Appendix I of this EIR) summarize the post-improvement roadway segment LOS under near- term and cumulative conditions, respectively.

It should be noted that the segment of Fowler Avenue, between Ticonderoga and Shepherd Avenue is forecast to operate at a deficient LOS under Cumulative (2046) without and plus project conditions. However, this segment is designated as a Rural collector (2-lanes) in the City's General Plan Circulation Element, and already constructed as per the General Plan Circulation Element designation. Additionally, the Project is not estimated to add any traffic at this segment during either peak hours. Therefore, no improvement has been recommended for this roadway segment.

With recommended improvements described in those chapters, all intersections would operate at LOS D or better with the addition of Project trips. Furthermore, in the absence of a fee program where the Project has an impact on the roadway network, the Project will pay its respective fair share for the proposed improvements. Therefore, implementation of the proposed Project would not result in a conflict with an existing or planned pedestrian facility, bicycle facility, or transit service/facility. Because the proposed Project would not conflict with adopted programs, plans, policies, or ordinances that address the circulation system, including transit, bicycle, and pedestrian facilities; this impact is considered **less than significant**.

Impact 3.13-3: Project implementation may increase hazards due to a design feature, incompatible uses, or inadequate emergency access. (Less than Significant)

The preliminary site plan indicates adequate emergency access would be provided and there do not appear to be any geometric hazards. Furthermore, a sight distance analysis was conducted at the Project driveways as part of the Transportation Impact Report by LSA, included in Appendix I of this EIR. Based on the sight distance analysis, the proposed Project driveways achieve adequate sight distances and have clear sight triangles for drivers.

With consideration to pedestrian safety to nearby schools, LSA recommends that a signal to be installed at the project access intersection under the with marked crosswalks and other safety improvements. As such, a safe walking route to the elementary school would be present for elementary school students from the Project.

All Project access intersections, internal intersections, and internal roadways are anticipated to be carefully designed to ensure they can accommodate emergency vehicles, subject to approval of the City of Clovis. All intersections and street sections would be reviewed by the City of Clovis and designed to comply with typical City standards.

Additionally, the proposed Project would not conflict with any program, plan, ordinance, or policy addressing the circulation system, substantially increase hazards due to a geometric feature, or result in inadequate emergency access. Therefore, implementation of the proposed Project would be **less than significant** relative to this topic.

UTILITIES 3.14

This section describes the regulatory setting, impacts associated with wastewater services, water services, storm drainage, and solid waste disposal that are likely to result from Project implementation, and measures to reduce potential impacts to wastewater, water supplies, storm drainage, and solid waste facilities. Information in this section is derived primarily from:

- *City of Clovis Urban Water Management Plan 2020 Update (Provost & Pritchard, 2021B);*
- *City of Clovis Water Shortage Contingency Plan 2020 Update (Provost & Pritchard, 2021A);*
- *City of Clovis Wastewater Master Plan Update Phase 3 (Provost & Pritchard, 2017);*
- *City of Clovis Recycled Water Master Plan (Provost & Pritchard, 2017);*
- *City of Clovis Water Master Plan Update Phase III (Provost & Pritchard, 2017);*
- *2014 Master Service Plan Update (City of Clovis, 2014);*
- *Provost & Pritchard Consulting Group. 2022. Water Supply Assessment, Northwest Sphere of Influence Expansion Area;*
- *Fresno- Clovis Storm Water Quality Management Program (Fresno Metropolitan Flood Control, 2013).*

There were several comments received during the NOP scoping process related to this environmental topic. Two members of the public are concerned about water supply, reliability, and availability with regards to private groundwater wells. Both the Fresno Irrigation District and Fresno Metropolitan Flood Control District provided comments as well, addressing water usage and stormwater management, respectively. These concerns have been addressed below.

3.14.1 WASTEWATER SUPPLY

ENVIRONMENTAL SETTING

A large portion of the City of Clovis' wastewater is treated at the Fresno-Clovis Regional Wastewater Reclamation Facility (RWRF), located southwest of the City of Fresno. It is approximately 16 miles by trunk sewer to the City of Clovis. Currently, the water is treated to the secondary level and then some is spread in percolation ponds and some is used directly on non-food crops. The plant can utilize extraction wells on the treatment plant property to pump water to reduce groundwater mounding under the plant. The pumped water can then be put into Dry Creek and the Houghton Canal for use by farmers downstream. FID in exchange can provide the City of Fresno approximately one AF of surface water for each two AF of water pumped and put into the canals, which is designated to be used as recharge on the east side of the District. Because Clovis contributes a percentage of the flow to the plant and pays a percentage share of maintenance, operations, and capital improvement costs, Clovis is also entitled to a proportionate share of any exchanged water and will be meeting with the City of Fresno and FID to discuss how to obtain said water. (Provost & Pritchard, 2021B).

Wastewater Collection System

The City's wastewater collection system is divided into seven major service areas. These seven major wastewater service areas also represent the City's entire water service area. Under existing conditions, the Herndon, Fowler, Sierra, and Peach service areas discharge into the City's regional trunks, which convey flows to the RWRF. Flow from the remaining three service areas (Northwest, Northeast, and Southeast) are conveyed to the Sewer Treatment - Water Reuse Facility (ST-WRF).

According to the 2017 Wastewater Collection System Master Plan, the City currently generates an Average Daily Flow of 7.018 million gallons per day (mgd) (7,861 Acre-Feet per Year (AFY)). In 2020, approximately 5.547 mgd (6,213 AFY) was conveyed to the RWRF, while 2.229 mgd (2,496 AFY) was treated at the ST-WRF; a total average daily flow of 7.775 mgd (8,710 AFY). (Provost & Pritchard, 2021B).

The City is exploring ways to recover the treated effluent either directly through a recycled water pipeline project or indirectly through exchanges.

Wastewater Treatment

Through a Joint Powers Agreement with the City of Fresno, the City of Clovis conveys much of its wastewater to the RWRF and is entitled to a maximum capacity of 9.3 mgd. The RWRF is operated by the City of Fresno and currently has a maximum capacity of 80 mgd. If required, the City has the capability to acquire additional capacity at the RWRF. (Provost & Pritchard, 2021B).

The City constructed a ST-WRF, which began service in 2009. The ST-WRF produces a disinfected tertiary treated water supply. The plant serves the new growth areas of the City in the Southeast, Northwest, and ultimately the Northeast Urban Centers. The ST-WRF is located on Ashlan Avenue, approximately 600 feet west of McCall Avenue. The facility was designed to treat an average daily flow of 2.8 million gallons per day (3,136 AFY) of wastewater. The plant is designed to accommodate future expansion and will ultimately treat 8.4 million gallons per day (9,400 AFY). In 2020, approximately 2,496 Acre-feet (AF) of wastewater was treated at the ST-WRF and 6,213 AF was treated at the RWRF. Of the 2,496 AF treated at the ST-WRF, 710 AF was used within the service area, while the remainder was discharged. (Provost & Pritchard, 2021B).

RECYCLED WATER

Currently, recycled water is used for irrigation of mostly public and some private landscape within the service area. 574 AF of recycled water was used in 2020 to irrigate landscape, while 136 AF was used for agricultural irrigation. Current areas receiving recycled water include Freeway 168 between Shepherd Avenue and Sierra Avenue, Clovis Community Medical Center, and multiple City parks and landscape areas.

Landscape irrigation will continue to be the main use of recycled water in the future for the City. All public landscape areas within three-quarters of a mile of the distribution system are considered potential recycled water use areas. Clovis Unified School District is evaluating the use of recycled water for its landscape areas. Caltrans has expanded their use of recycled water along Freeway 168 from Armstrong Avenue west to Sierra Avenue. This increase in volume and expansion of uses is expected to increase due to proactive actions taken by the City, which are described in a subsequent section. The City is very interested in exploring the use of recycled water for groundwater recharge. The water could be provided to recharge facilities during periods when no raw water supplies are available or to supplement raw water supplies.

Recycled water produced by the tertiary treatment plant is used for agricultural purposes when excess water is available. The City currently has a farmer adjacent to the ST-WRF that uses surplus recycled water to irrigate agricultural crops. The crops to be irrigated include almonds, citrus, and alfalfa. Farmers in the International Water District area are also interested in utilizing the water to irrigate crops which mainly are citrus. Currently, this area is not in the City's service area. Excess recycled water supplies are currently discharged to Fancher Creek and conveyed through irrigation canals to agricultural lands southwest of Clovis, or to the Little Dry Creek Diversion channel.

There are currently no wildlife habitat areas or wetlands within the Clovis service area. Potentially, the water discharged to FID could be used for wetlands or wildlife habitat enhancement areas.

The water could also potentially be used by future industrial customers within the new growth areas of the City; however, it will depend on their needs and their proximity to the recycled water transmission and distribution lines. At this point none have been specifically identified.

REGULATORY SETTING

Clean Water Act (CWA) / National Pollutant Discharge Elimination System (NPDES) Permits

The CWA is the cornerstone of water quality protection in the United States. The statute employs a variety of regulatory and non-regulatory tools to sharply reduce direct pollutant discharges into waterways, finance municipal wastewater treatment facilities, and manage polluted runoff. These tools are employed to achieve the broader goal of restoring and maintaining the chemical, physical, and biological integrity of the nation's waters so that they can support "the protection and propagation of fish, shellfish, and wildlife and recreation in and on the water."

The CWA regulates discharges from "non-point source" and traditional "point source" facilities, such as municipal sewage plants and industrial facilities. Section 402 of the Act creates the NPDES regulatory program, which makes it illegal to discharge pollutants from a point source to the waters of the United States without a permit. Point sources must obtain a discharge permit from the proper authority (usually a state, sometimes EPA, a tribe, or a territory). NPDES permits cover industrial and municipal discharges, discharges from storm sewer systems in larger cities, stormwater associated with numerous kinds of industrial activity, runoff from construction sites disturbing more than one acre, mining operations, and animal feedlots and aquaculture facilities above certain thresholds.

Permit requirements for treatment are expressed as end-of-pipe conditions. This set of numbers reflects levels of five key parameters: (1) biochemical oxygen demand (BOD), (2) total suspended solids (TSS), (3) pH acid/base balance, (4) Ammonia, and (5) Nitrate. These levels can be achieved by well-operated sewage plants employing "secondary" treatment with denitrification. Primary treatment involves screening and settling, while secondary treatment uses biological treatment in the form of "activated sludge." Denitrification uses the activated sludge process to remove nitrogen from the wastewater.

All so-called "indirect" dischargers are not required to obtain NPDES permits. An indirect discharger is one that sends its wastewater into a city sewer system, so it eventually goes to a sewage treatment plant. Although not regulated under NPDES, "indirect" discharges are covered by another CWA program called pretreatment. "Indirect" dischargers send their wastewater into a city sewer system, which carries it to the municipal sewage treatment plant, through which it passes before entering surface water.

The City's current Waste Discharge Requirements and Master Recycling Permit, which regulates the wastewater effluent quantity and quality upon discharge, was issued by the Central Valley Regional Water Quality Control Board and is Order R5-2019-0021 NPDES No. CA0085235.

Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act is California's statutory authority for the protection of water quality. Under the Porter-Cologne Act, the State is required to adopt policies, plans, and objectives that will protect the State's waters for the use by and enjoyment of Californians. In California, the State Water Resources Control Board (SWRCB) has the authority and responsibility for establishing policy related to the State's water quality. Regional authority is delegated by the SWRCB to a Regional Water Quality Control Board (RWQCB). The Porter-Cologne Act authorizes the SWRCB and RWQCB to issue NPDES permits.

Under the Central Valley Regional Water Quality Control Board (CVRWQCB) NPDES permit system, all existing and future municipal and industrial discharges to surface water within the City would be subject to regulation. NPDES permits are required for operators of municipal separate storm sewer systems, construction projects, and industrial facilities. These permits contain limits on the amount of pollutants that can be contained in each facility's discharge.

City of Clovis General Plan

Policies: Land Use Element

- Policy 3.5 Fiscal sustainability. The City shall require establishment of community facility districts, lighting and landscaping maintenance districts, special districts, and other special funding or financing tools in conjunction with or as a condition of development, building or permit approval, or annexation or sphere of influence amendments when necessary to ensure that new development is fiscally neutral or beneficial.

Policies: Public Facilities & Services Element

- Policy 1.1 New development. New development shall pay its fair share of public facility and infrastructure improvements.
- Policy 1.3 Annexation. Prior to annexation, the city must find that adequate water supply and service and wastewater treatment and disposal capacity can be provided for the proposed annexation. Existing water supplies must remain with the land and be transferred to the City upon annexation approval.
- Policy 1.4 Development-funded facilities. The City may require developments to install onsite or offsite facilities that are in excess of a development's fair share. However, the City shall establish a funding mechanism for future development to reimburse the original

development for the amount in excess of the fair share costs.

- Policy 1.6 Master plans. Periodically update water, recycled water, wastewater, and stormwater master plans and require all new development to be consistent with the current master plans.
- Policy 1.8 Water facility protection. Protect existing and future water, wastewater, and recycled water facilities from encroachment by incompatible land uses that may be allowed through discretionary land use permits or changes in land use or zoning designations.

Policies: Environmental Safety Element

- Policy 1.3 Geologic and seismic risk. Prohibit development on unstable terrain, excessively steep slopes, and other areas deemed hazardous due to geologic and seismic hazards unless acceptable mitigation measures are implemented. Require that underground utilities be designed to withstand seismic forces and accommodate ground settlement.

City of Clovis Municipal Code

Municipal Code Chapter 3.10 Development Impact Fees, The purpose of this chapter is to establish a uniform set of procedures applicable to AB 1600 development impact fees that are adopted pursuant to the authority set forth in Government Code Section 66000 et seq. and the Municipal Code. These procedures are intended to apply to all AB 1600 development impact fees adopted by the City regardless of whether there is an existing similar provision in the applicable chapter or section of the Municipal Code establishing the fee. If there is a conflict between this chapter and an existing similar provision in the applicable chapter or section of the Municipal Code establishing the fee, the provisions of this chapter shall control.

Municipal Code Chapter 6.4 pertains to Sewage Disposal regulations. This chapter establishes the sewer connections and permits required to safely create a functioning sewer system both in tandem with the City system, and outside the City. This Chapter also establishes sewer service charges and fees. Chapter 6.8, Recycled Water Use, provides for and encourages the use of recycled water in a manner that ensures the health, safety, and general welfare of the residents pursuant to and consistent with all applicable laws including, but not limited to, the California Code of Regulations Title 17 and 22.

The City Municipal Code also contains Chapter 8.6, Plumbing Code. This Chapter adopts the California Plumbing Code and includes specific amendments.

Clovis Wastewater Master Plan (2017)

The Clovis Wastewater Master Plan Update, Phase 3 was adopted in 2017. The Wastewater Master Plan Update process consisted generally of developing design criteria, defining wastewater service areas, developing wastewater flow projections, analyzing and designing collection system pipelines, and summarizing results. The Wastewater Master Plan Update, Phase 3, (2017 Master Plan) is the latest phase of an effort begun in 1995 to update the City’s Wastewater Master Plan. The preceding phase, referred to as the Wastewater Master Plan Update, Phase 2, (2008 Master Plan) was documented in a final report dated June 30, 2008. Under the 2017 Master Plan, the core of the City is planned to discharge to regional trunk sewers and on to the Fresno-Clovis RWRF in southwest Fresno.

Clovis Recycled Water Master Plan (2017)

The City of Clovis released a Recycled Water Master Plan in 2017. This Plan demonstrates how the water systems in the City will accommodate future population growth. Due to the impact of a five-year drought throughout the State, the scarcity of water supplies has resulted in significant motivation to continue investment in the use of recycled water to meet water demands. The purpose of the Clovis Recycled Water Master Plan Update is to evaluate current recycled water use, identify additional market opportunities as defined in the adopted General Plan and produce an implementation plan incorporating recycled water as a significant portion of the Clovis' water supply. The efficient use of surface water and groundwater resources is critical to maintaining sustainability of communities throughout the Central Valley. To help alleviate potable water demands placed on these supplies, recycled water is a key source of supply many communities, including Clovis, utilize to enhance management of local water resources.

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the proposed Project will have a significant impact on the environment associated with Utilities if it will:

- Require or result in the relocation or construction of new or expanded wastewater facilities, the construction or relocation of which could cause significant environmental effects; and/or
- Result in a determination by the wastewater treatment provider which serves or may serve the Project that it does not have adequate capacity to serve the project's projected demand in addition to the providers existing commitments.

IMPACTS AND MITIGATION MEASURES

Impact 3.14-1: The proposed Project would not result in a determination by the wastewater treatment provider which serves or may serve the Project that it does not have adequate capacity to serve the project's projected demand in addition to the providers existing commitments (Less than Significant)

WASTE DISCHARGE REQUIREMENTS (WDRS) BOARD ORDER NUMBER NO. 5-2019-0021 (NPDES PERMIT NO. CA0085235).

A large portion of the City of Clovis' wastewater is treated at the Fresno-Clovis Regional Wastewater Reclamation Facility (RWRF), located southwest of the City of Fresno. Through a Joint Powers Agreement with the City of Fresno, the City of Clovis conveys much of its wastewater to the RWRF and is entitled to a maximum capacity of 9.3 mgd. The RWRF is operated by the City of Fresno and currently has a maximum capacity of 80 mgd.

The ST-WRF serves the new growth areas of the City in the Southeast, Northwest, and ultimately the Northeast Urban Centers. With a total average daily flow of 2.8 million gallons per day (3,136 AFY), the plant is designed to accommodate future expansion and will ultimately treat 8.4 million gallons per day (9,400 AFY). The Project site would be served by a new wastewater collection system installed within proposed public utilities easements that would ultimately be conveyed to the ST-WRF.

The proposed Project would increase the amount of wastewater requiring treatment. According to the City's 2017 Wastewater Master Plan Update, single family residential uses are estimated to generate 55 gallons per capita per day or 175 gallons per day per equivalent dwelling unit (edu). The Project site includes up to 605 single family residential units. Using this rate, the proposed Project would generate approximately 105,875 gallons per day of wastewater. Occupancy of the proposed Project would be prohibited without sewer allocation. An issuance of sewer allocation from the City's available capacity would ensure that there would be a final determination by the wastewater treatment and/or collection provider that there is adequate capacity to serve the proposed Project's projected demand in addition to the provider's existing commitments. Additionally, any planned expansion to the RWTF with a subsequent allocation of capacity to the proposed Project would ensure that there would not be a determination by the wastewater treatment and/or collection provider that there is inadequate capacity to serve the proposed Project's projected demand in addition to the provider's existing commitments.

The ST-WRF is currently in compliance with the WDR requirements of Order Number No. 5-2019-0021 (NPDES Permit No. CA0085235). The projected flows of the proposed Project are not expected to exceed the treatment capacity available for treatment. Full buildout of the proposed Project would slightly increase the existing treatment demand at the ST-WRF. As described above, the City must also periodically review and update their Utility Master Plans, including the Wastewater Master Plan, and as growth continues to occur within the City, the City will identify necessary system upgrades and capacity enhancements to meet growth, prior to the approval of new development. These pre-existing proactive efforts ensure the City would be able to reliably treat the wastewater as the community expands its population up to and through the next plant expansion, including with implementation of the proposed Project.

The City General Plan designates the Development Area as Rural Residential and therefore anticipated potential development. Given that projected wastewater generation volumes associated with the buildout of the Development Area would not exceed the projected wastewater generation volumes described in the Wastewater Master Plan and the Urban Water Management Plan, this impact would be **less than significant**, and no mitigation is required.

Impact 3.14-2: The proposed Project would not require or result in the relocation or construction of new or expanded wastewater facilities, the construction or relocation of which could cause significant environmental effects (Less than Significant)

As Clovis continues to develop in the future, there will be an increased need for water and wastewater services, including a reliable source of recycled water. These needs have been addressed in the Clovis Wastewater Master Plans and will require that the City continue to implement improvements to some pump stations, and sewer mains when triggered by growth.

The overall collection sewer strategy for the City of Clovis, including the proposed Project, consists of a combination gravity sewer collection system with pump or lift stations located along the collection system to convey wastewater to influent the ST-WRF.

The Project site would be served by a new wastewater collection and conveyance system installed within proposed public utilities easements. The proposed wastewater conveyance facilities would connect to the existing sewer mains as part of the City of Clovis collection and treatment system. Wastewater treatment would be provided at the ST-WRF, although in the interim it may receive treatment at the existing Fresno-Clovis Regional Wastewater Treatment Plant in the City of Fresno.

The wastewater collection and conveyance system that will serve the proposed Project will consist of engineered infrastructure consistent with the City's existing infrastructure requirements. New wastewater collection and conveyance infrastructure needed for the proposed Project will require trenching/excavation of earth, and placement of pipe within the trenches at specific locations, elevations, and gradients. The applicant will refine the wastewater collection/conveyance infrastructure design through the development of improvement plans which undergo review by the City of Clovis Engineering Department to ensure consistency with the City of Clovis standards and specifications. This improvement plan process will include full engineering design (i.e., location, depth, slope, etc.) of all conveyance infrastructure as well as a review of new sewer pump stations and new force mains if needed. Ultimately, the sanitary sewer collection system will be an underground collection system installed as per the City of Clovis standards and specifications.

CONCLUSION

The construction of the new wastewater facilities, which are associated with future buildout of the proposed Project, has the potential to cause environmental impacts. The potential for environmental impacts associated with the installation of the wastewater system, and all construction activities within the Development Area of the Project site, are addressed throughout this EIR. There are no other anticipated impacts associated with the infrastructure construction activities beyond what is already discussed throughout this EIR.

The installation of the wastewater collection and conveyance system infrastructure to serve the proposed Project would have a less than significant impact relative to this topic. The wastewater treatment plant would not require upgrades or improvements in order to serve the proposed Project. Development of the proposed Project would have a **less than significant** impact relative to this topic.

3.14.2 WATER SUPPLIES

The following information is based on the *City of Clovis Urban Water Management Plan 2020 Update (Provost & Richard, 2021B); City of Clovis Water Shortage Contingency Plan 2020 Update (Provost & Pritchard, 2021A);* and the *City of Clovis Water Master Plan Update Phase III (Provost & Pritchard, 2017),* which is included as Appendix J of this Draft EIR.

ENVIRONMENTAL SETTING

The City of Clovis water service area largely aligns with the City's annexed boundaries. According to the *City of Clovis Urban Water Management Plan 2020 Update* (UWMP), the City's water system provides water supplies to approximately 122,350 people throughout the City of Clovis and the county island of Tarpey Village. The overall system demands have been increasing in the past five years due to population growth. However, the water use per person saw a sharp decline in 2015 in response to mandatory drought restrictions, followed by a slight increase as the 2012-2016 drought ended. Usage has remained well below pre-drought levels since 2016. (Provost & Pritchard, 2021B).

The City has three main water supply sources: groundwater, surface water, and recycled water. As the City continues to grow, it intends to expand its surface water supply use, recycled water use, and to continue intentional groundwater recharge efforts to relieve pressure on the groundwater aquifer. (Provost & Pritchard, 2021B).

The City's Public Utilities Department is responsible for water service within the City (Provost & Pritchard, 2021B). The City's water supply operates via a network of water mains and wells, and maintains treatment and/or disinfection facilities on all City wells thus ensuring high quality drinking water that meets all state and federal standards. The Public Utilities Department operates and maintains the City's Surface Water Treatment Plant and manages all surface water supplies including the acquisition of new supplies for developing areas of the City. This Public Utilities Department also conducts groundwater recharge programs, the water conservation program, rate analyses, and master planning.

The City has 37 water wells to provide for the needs of its residents. Some of these have wellhead treatment facilities to treat contaminated water. The wells discharge water into a distribution main grid, based on a minimum of 12-inch mains, spaced at half-mile intervals.

The City began operations of the Surface Water Treatment Plant (SWTP), located on the Enterprise Canal on the east side of Clovis, in 2004. Kings River water is supplied to the plant via Fresno Irrigation District's (FID) Enterprise Canal. This 22.5 million-gallons-per-day plant allows Clovis to serve existing users and new growth areas, while lessening the demand on groundwater.

City of Clovis Water Service Area

The City is located in the northeast quadrant of the Fresno-Clovis Metropolitan Area and is situated in the midst of the agriculturally rich San Joaquin Valley. The City limits currently encompass 25.9 square miles. The City's Sphere of Influence (SOI) covers 34.9 square miles, while the City's General Plan encompasses approximately 74.3 square miles. (Provost & Pritchard, 2021B).

According to the UWMP, the City's Public Utilities Department is the only municipal water purveyor in the City and provides service to approximately 122,350 City-customers. The City's service area encompasses the City limits and the small unincorporated community of Tarpey Village. The City's 2020 population was 118,741 while Tarpey Village has an estimated population of 3,609 and is mainly comprised of residential housing. (Provost & Pritchard, 2021B).

Within the City's General Plan Area but outside of the SOI are three county service areas (CSA) and one waterworks district (WWD) that provide water service. Currently, the three CSAs and WWD are considered independent of the City's utilities and service system. (Provost & Pritchard, 2021B).

Current and Projected Population

According to data collected from the California Department of Finance (DOF), the City's population for the year 2020 was approximately 118,741, while the American Community Survey, 5-year estimates (2015-2019) reported that Tarpey Village had a population of 3,609. This corresponds to a service area population of 122,350. The Tarpey Village area is considered built-out; therefore, the population is assumed to remain constant. The City's population increase over the last ten years has averaged 2.2 percent annually, from 100,895 in 2011 to 118,741 in 2020. It is generally accepted by the City the population growth will slow, meeting the 2040 projection of 174,500 (for Clovis only), yielding a growth rate of 1.9 percent annually. (Provost & Pritchard, 2021B).

Within the City's service area, the documented population is served water supply through the City's water system and, as the City develops, it is currently anticipated the projected population will be served by the City's water system; therefore, all population projections are utilized in water system demand projections. (Provost & Pritchard, 2021B).

TABLE 3.14-1: EXISTING AND PROJECTED POPULATION

	2020	*2025*	*2030*	*2035*	*2040*
Total Water Demand	122,350	135,015	148,045	162,367	178,109

SOURCE: PROVOST & PRITCHARD, 2021B

Climate

The climate in the City can be classified as a Mediterranean-type climate. Summers are hot and dry, and winters are cool with an average precipitation of about 10.72 inches per year. The area is subject to significant variations in annual precipitation. Most of the annual precipitation occurs during the period from November through April. (Provost & Pritchard, 2021B).

The mean annual precipitation is approximately 10 inches. The City experiences hot summer temperatures with many days in the 90°F range from June to September. The average annual temperature is 64.6 degrees Fahrenheit (°F), although it is not unusual for summer readings to reach well over 100°F. Nighttime temperatures from June to September hover around mid-sixties. The winter temperatures are much colder, with nighttime highs in the forties. Spring and fall provide moderate temperature ranges. A greater quantity of water is evaporated during May through August in correlation to high temperatures and low humidity, which results in high water demand for landscape irrigation. (Provost & Pritchard, 2021B).

City of Clovis Water Demands

At the General Plan planning horizon in 2035, total demand within the sphere of influence (SOI) is projected to be over 46,000 acre-feet per year (AFY). Total supply is expected to be 65,034 AFY. Development to the limits of the SOI is expected to continue the present course of development of surface supplies. The level of reliance on groundwater is planned to stay the same and additional supplies are planned to be served by an expansion of 22.5 MGD at the current SWTP and construction of a second SWTP with capacity of approximately 20 MGD. If there are opportunities for expanded intentional recharge, they are expected to be pursued. (ICF, 2018).

The City UWMP buildout is projected for the year 2083, at which time the population of Clovis is estimated to be 280,000. The average demand for City water at buildout will be approximately 65,400 AFY based on land use demand factors. Surface water requirements are anticipated to increase significantly by 2083. Much of the planned development outside the SOI is in an area with limited groundwater resources and will require the acquisition of surface water supplies. Since this area is outside organized irrigation and water district agencies, it will also be important for the City to contract for surface supplies long before they are needed. Expansion of the surface water treatment facilities is estimated to total approximately 45 MGD. Projected growth will more than double the peak need for water deliveries. The City plans to add new supplies in accordance with increased demands. The City's existing system has sufficient supplies to meet the demands of planned development within the City's current SOI boundary to 2035.

City potable and non-potable water demand in 2020 was approximately 30,144 AF. Table 3.14-1 represents the total sum of projected water demands for potable and raw use within the service area. These demands represent the City's total water demand in the future (recycle water is included). The 2020 data reflects actual 2020 water usage. Table 3.14-2 is completed for 'normal' years when no drought conditions are present and water supplies are available in their expected quantities. (Provost & Pritchard, 2021A).

TABLE 3.14-2: EXISTING AND PROJECTED TOTAL WATER DEMAND IN NORMAL YEARS, AFY

	2020	*2025*	*2030*	*2035*	*2040*
Total Water Demand	30,854	39,737	42,824	46,422	52,598

SOURCE: PROVOST & PRITCHARD 2021B; TABLE 4.6

DRY YEAR WATER DEMAND

The City currently has a water conservation program in place, as described in the City 2020 Water Shortage Contingency Plan (WSCP). The City has six triggering levels which correspond to water shortage levels. The water shortage levels are defined based on the percent reduction in available water supply when compared to a typical year. Each water shortage level has an accompanying goal for water consumption reduction varying from 10 percent to more than 50 percent. The water shortage levels, and their respective anticipated reduction in potable water demand, are shown in 3.14-3.

TABLE 3.14-3: WATER SHORTAGE CONTINGENCY PLAN PROJECTED DEMAND REDUCTION

LEVEL	PERCENT SUPPLY REDUCTION
I	Up to 10 percent
II	Up to 20 percent
III	Up to 30 percent
IV	Up to 40 percent
V	Up to 50 percent
VI	Over 50 percent

SOURCE: PROVOST & PRITCHARD, 2021A, TABLE 4-1

As discussed in the City's 2020 UWMP (Provost & Pritchard, 2021B), the reliability of the water system is reasonably robust; however, in a multiple dry year condition, the City will need to enact the WSCP to reduce demands. Table 3.14-4 displays the normal, single-dry, and multiple dry year demand comparisons. All years of the multiple dry year scenario utilize WSCP levels of conservation efforts. (Provost & Pritchard, 2021A).

TABLE 3.14-4: PROJECTED FUTURE DRY YEAR POTABLE AND RAW WATER DEMAND

HYDROLOGIC CONDITION	2025	2030	2035	2040
Normal Dry Year, AFY	39,737	42,824	46,422	52,598
Single Dry Year, AFY	34,272	37,359	40,957	47,133
Multiple Dry Year 1	36,489	39,422	42,840	48,707
Multiple Dry Year 2	34,183	36,962	40,200	45,758
Multiple Dry Year 3	31,346	33,969	37,028	42,277
Multiple Dry Year 4	28,005	30,474	33,353	38,293
Multiple Dry Year 5	37,825	40,758	44,176	50,043

WATER SUPPLIES

Surface Water Supply

The City has access to surface water through several different contracts, all of which are delivered to the City by the Fresno Irrigation District (FID). The various surface water supplies are from the Kings River. The Central Valley Project is a planned supply for the future. The average delivery the City has received of its total allocation is just over 17,000 AF per year, with the smallest delivery being 9,452 AF in 2015 and the largest of 24,958 in 2017. The City executed a new, firm water supply, agreement with FID in 2019 that provides a surface water supply that does not fluctuate with the FID entitlement or allocation and will be available to the City on a consistent basis. This agreement provides for up to 7,000 AF per year by 2045, beginning at 1,000 AF in 2020. As the City grows and annexes portions of the Garfield and International Water Districts, those CVP, Class I water rights will be transferred to the City and added to the overall water supply portfolio. (Provost & Pritchard, 2021B).

FID's average gross annual entitlement is 452,541 AF. Within the last fifty years, the smallest entitlement received was 158,109 AF, which occurred in 2015. The City's allocation from the Kings River is proportional to the total acreage of the City's included area to the total FID area receiving water. Over time, the City has received on average 17,011 AFY, though this has varied from 9,452 AF in the severe drought of 2015 to over 24,958 AF in 2017. (Provost & Pritchard, 2021B).

Two additional water districts are located within the City's General Plan Boundaries: Garfield Water District (GWD) and International Water District (IWD). Both have access to Class I CVP surface water supplies. The GWD holds a Class 1 CVP contract for 3,500 AFY. With half of GWD within the City's SOI, an estimated 1,750 AFY is expected to be added to the City's supply upon development. The IWD holds a Class 1 CVP contract for 1,200 AFY. The City's General Plan designates a portion of the District's area as industrial and residential use. At build-out it is estimated that the entire 1,200 AFY supply will be added to the City's Supply. As the districts urbanize, supplies associated with these areas are expected to be added to the City's supply. The City uses their surface water supplies in two primary ways: (1) as potable water supply after being treated at the City's Surface Water Treatment Plant (SWTP) or (2) as groundwater recharge in various basins located in and around the City's service area. (Provost & Pritchard, 2021B).

Groundwater Supply

The City's groundwater supplies stem from the basin underlying the area, the Kings Subbasin; the Subbasin holds a status of being critically over drafted. The Kings Subbasin, a non-adjudicated basin, is a high-priority basin which lies within the Tulare Lake Hydrologic Basin. This Basin contains multiple interconnected subbasins that transmit, filter, and store water. These subbasins are Kaweah and Tulare Lake to the south, Westside and Delta Mendota to the west, and Madera to the North. (Provost & Pritchard, 2021B).

The Kings Subbasin (Subbasin 5-22.08) covers a surface area of approximately 976,000 acres (1,530 square miles). The Department of Water Resources estimated that the total basin storage was about 93,000,000 AF to a depth of more than 1,000 feet. The two major rivers overlying the subbasin are the San Joaquin River and Kings River. The Fresno Slough and James Bypass are along the western edge of the southern basin and connect the Kings River to the San Joaquin River. (Provost & Pritchard, 2021B).

The subbasin does have localized water quality impairments, including Dibromochloropropane (DBCP); Nitrate; Ethylene-Dibromide; 1,2,3-Trichloropropane (TCP); Methyl Tert-butyl Ether (MTBE); uranium; arsenic; hexavalent chromium; perfluoroalkyl substances (PFAS) and petroleum hydrocarbons. High concentrations of fluoride, boron, and sodium can be found in localized areas of the subbasin. (Provost & Pritchard, 2021B).

In 2014, the Sustainable Groundwater Management Act (SGMA) was signed into law to provide a framework for management of groundwater supplies by local agencies and restricts state intervention, if required. SGMA provides an opportunity for local agencies overlying the basin to form a Groundwater Sustainability Agency (GSA), which is the primary agency responsible for achieving sustainability. As part of the region's compliance with SGMA, the North Kings Groundwater Sustainability Agency (NKGSA) was formed and includes representatives from Bakman Water Company, Biola Community Services District, City of Fresno, City of Clovis, City of Kerman, County of Fresno, Fresno Irrigation District, Fresno Metropolitan Flood Control District, Garfield

Water District, and International Water District. The North Kings Groundwater Sustainability Agency adopted a Groundwater Sustainability Plan (GSP) in late 2019.

NORTH KINGS GROUNDWATER SUSTAINABILITY AGENCY

The City is a member of the North Kings Groundwater Sustainability Agency (NKGSA). The NKGSA is working collaboratively, under a coordination agreement with the other six (6) Groundwater Sustainability Agencies in the Kings Subbasin to achieve sustainable groundwater conditions by 2040 in accordance with the Sustainable Groundwater Management Act of 2014 (SGMA) for critically over drafted groundwater basins such as the Kings Subbasin. (Provost & Pritchard, 2021B).

SGMA identifies six (6) sustainability indicators to be monitored and reported in order to document sustainability: lowering groundwater levels, reduced [groundwater] storage, seawater intrusion, degraded [groundwater] quality, land subsidence, and surface water depletion. The NKGSA documents five (5) of those with seawater intrusion not being applicable to this region. (Provost & Pritchard, 2021B).

The City will continue increasing its surface water and recycled water supply usage to a point where the groundwater extraction is not greater than the sustainable yield in a normal year. The sustainable yield is currently estimated at 9,400 AF per year (AFY) for the SOI). (Provost & Pritchard, 2021B).

Potable water production consists of municipal groundwater wells and a Surface Water Treatment Plant (SWTP). The total groundwater pumping that occurs within the City boundaries include City-owned municipal wells and City-owned park irrigation wells. It is noted that there are other wells within the boundaries of the City of Clovis including CUSD irrigation wells and rural residential domestic wells. The following section provides a summary of the estimated groundwater pumping that occurs within the current City limits and planning area.

City-Produced Groundwater

The City's system contains more than 37 active permitted wells with a total capacity of approximately 37,690 gallons per minute with another 4,750 gpm of additional capacity planned in the next few years. In 2020, the City extracted 12,105 AF and conducted 5,316 AF of intentional recharge activities, which put the net extraction below the sustainable yield. It is presently understood that 9,400 AF per year can be sustainably used from the aquifer. (Provost & Pritchard, 2021B).

Wells are spaced at intervals across the City and are connected to a distribution system. The pipes are sized for local distribution and have, in certain instances, presented some restrictions to cross-town water supply distribution. The transmission network consists primarily of 12-inch mains on a one-half mile grid with extensive looping. The wells are controlled by a telemetry system that controls pump operation as well as independent controls in case of remote computer failure. The production rate of the existing wells varies from approximately 300 gallons per minute (gpm) to approximately 2,200 gpm. (Provost & Pritchard, 2017).

HISTORICAL GROUNDWATER PUMPING

The water system was initially constructed near the turn of the 20th century, when the first municipal well was installed, and up until July 2004, the City's sole source of drinking water was groundwater. The City currently obtains groundwater from 37 active permitted wells and one standby well, which have a total capacity of approximately 37,690 gallons per minute (gpm). There are also six planned wells, adding an additional planned capacity of 4,750 gpm, bringing the total well capacity to 42,440 gpm. In 2023, seven of the existing active wells (Wells 10, 18, 31, 32, 36, 40, and T-5) are offline due to Nitrate, Iron, Manganese, TCP, or PFAS water quality concerns, and one well (Well 20) is listed as standby due to iron and manganese concerns. TCP, PFAS, DBCP and high iron (Fe) and manganese (Mn) are the main water quality constraints in the Clovis area. Four (4) more of the City's wells are currently on inactive status due to being dry or producing too much sand (Wells 3, 11, T-1, and T-3). (Provost & Pritchard, 2021B).

In 2020, groundwater provided approximately 49 percent of the total potable water use. The historical volume of groundwater pumped by the City over the past five years is provided in Table 3.14-5. The groundwater extraction has reduced since 2016 and is expected to continue to be reduced, as discussed later in this section. (Provost & Pritchard, 2021B).

In 2020, recharge was 5,316 AF, while the City's 30-year average groundwater recharge quantity is approximately 8,412 AFY. In the past 30 years the groundwater table has dropped 48 feet, from a depth of 92 feet in 1991 to a depth of 140 feet in 2019. Recharge efforts began in 1974, and in 2004 the City began utilizing surface water with the goal of reducing groundwater extraction. Recharge efforts by the City have not been enough to stem the decline as the basin is shared with other users who either don't recharge or inadequately recharge. (Provost & Pritchard, 2021B).

Groundwater pumping by City wells (potable and irrigation) from 2016 to 2020 is summarized in Table 3.14-5.

TABLE 3.14-5: HISTORICAL GROUNDWATER PRODUCTION

Recycled Water

The City's ST-WRF produces tertiary treated effluent that can be used for a variety of applications but is primarily used either as agriculture or landscape irrigation, with the remaining being discharged to nearby creeks. The City intends to continue to expand the beneficial users of the recycled water supply and show the volumes in the water supply portfolio. Use of recycled water in this manner will continue to offset the City's use of potable sources for non-potable demands, such as irrigation. (Provost & Pritchard, 2021B).

Currently, the City provides recycled water for landscape and agricultural irrigation at 66 metered sites (through 129 metered services). There is a goal of expanding the users to include schools within the Clovis Unified School District in the future as discussed in the City's Recycled Water Master Plan (RWMP) (Provost & Pritchard, 2021B).

A total of 574 AF of recycled water was used in 2020 to irrigate landscape, while 136 AF was used for agricultural irrigation. Current areas receiving recycled water include Freeway 168 between Shepherd Avenue and Sierra Avenue, Clovis Community Medical Center, and multiple City parks and landscape areas. (Provost & Pritchard, 2021B).

Potable Water Supply Availability and Reliability

The City's surface water and groundwater supply reliability as described in the City's 2020 UWMP is summarized below.

SURFACE WATER RELIABILITY

Surface water is supplied from the Kings River and conveyed to the City by the FID. The Kings River is impacted by the level of snowmelt and precipitation received in the area and is susceptible to dry conditions. The City's contract with FID ensures that the City receives a percentage of the total FID entitlement, approximately 2.1 AF per acre within the FID boundary; the City's area is capped at 7.12 percent of the FID boundary or approximately 32,100 AFY in a normal water year. Additionally, the City has recently executed an additional contract with FID for development of a new, firm water supply starting at 1,000 AFY in 2020 and increasing to a maximum of 7,000 AFY by 2045 and thereafter; this new supply will not have the variability of the existing supply based on water year. Historically, FID's entitlement on the Kings River has been considered reliable although it was affected significantly by the recent drought.

The most probable water supply in the City's portfolio to be impacted by climate change is the surface water supply. The NKGSP examined the reliability of the Kings River supply and concluded that the agencies reliant on the Kings Subbasin could continue to plan on those supplies with climate change factored in, stating specifically, "Kings River water supplies available to the Kings Subbasin will be managed in the future to maintain historical levels of water supplies." Evaluation of the Kings River supplies into the future, considering climate change impacts of warmer temperatures, showed more precipitation occurring as rainfall and less as snowfall and that the snowfall (snowpack) will have a tendency to melt sooner in the season. The biggest impact this shift will have is on water management, including additional reservoir storage and increased recharge during low-use periods. The GSP further states that "climate change will have no significant impact on Kings River diversions." (Provost & Pritchard, 2021B).

The supply is greater than the demand for each year and reflects the projected surplus during a normal water year. During a single-dry year, surface water allotments are anticipated to be reduced by as much as 66 percent for Kings River surface water supplies, and CVP Class II supplies are eliminated completely in dry years. In the future, as the City becomes more reliant on surface water supplies, the impact of surface water reductions in dry years will be more significant. Demand reductions due to water shortage measures are included in the demand estimates. During a single-dry year demands will be reduced by temporarily eliminating groundwater recharge activities and implementing the water shortage contingency plan as necessary. (Provost & Pritchard, 2021B).

To provide protection for the system, planning for a 20 percent supply excess over demands is a guiding principle. Therefore, while during the first-year adequate supplies are available for normal demands and no demand reductions are required, voluntary conservation will be promoted, and recharge activities may be curtailed to maintain an adequate supply buffer for the system. During the subsequent second, third, and fourth years, the Water Shortage Contingency Plan will be implemented with varying levels of mandatory conservation required for all users. In addition, the City may choose to reduce groundwater recharge activities and will be utilizing banked groundwater to augment the City's supply. As with the 2012-2016 drought period, it is anticipated the final year will begin to see an improvement in supply availability and some restrictions may be relaxed; however, if that is not the case, the City may need to continue mandatory conservation strategies. (Provost & Pritchard, 2021B).

The water obtained from the Central Valley Project comes from the diversion and storage of water from the San Joaquin River behind Friant Dam. The total available water on the San Joaquin River has been estimated at 2,200,000 AF. Of that, 800,000 AF have been designated as Class I supply. Class I supply is considered to be dependable in most years with shortages only in very dry years. Class II water is in excess of Class I and is therefore much less dependable. FID has a contract with the United States Bureau of Reclamation for 75,000 AF of Class II water from this source. The agreement between the City and FID requires the District to make available to the City the proportional share of all surface water available to the District although it does not allow the City to directly receive FID's Central Valley Project supplies. Therefore, FID is required to make a like amount of Kings River (or any other surface) water available to the City for its proportional share of Class II Central Valley Project supplies. FID's Class II contract has received an average 13,577 AFY with the actual number ranging from zero to the full 75,000 AF depending upon the nature of each water year over that period. (Provost & Pritchard, 2021B).

GROUNDWATER RELIABILITY

There are many factors that can affect groundwater supply reliability, including current storage conditions, water quality, seasonal groundwater level variations and climate change. Reduced use by the City, combined with seasonal variations such as intense wet seasons, can result in increased groundwater table elevation.

Since the 2015 UWMP, SGMA has become effective, and the City is working collaboratively with other agencies reliant on the groundwater basin to reach sustainable management of the groundwater aquifer prior to 2040, as required. The supply from groundwater sources has been modified to reflect this change in the City's supply portfolio. In the 2010 and 2015 UWMPs, the City's groundwater supplies were shown to be increasing with population growth into the future. The historical volume of groundwater pumped by the City from 2016 to 2020 ranged from 10,956 in 2019 to as high as 13,187 in 2016. In 2020, the City extracted 12,105 AF and conducted 5,316 AF of intentional recharge activities, which put the net extraction below the sustainable yield. It is presently understood that 9,400 AF per year can be sustainably used from the aquifer. (Provost & Pritchard, 2021B). The City's 30-year average groundwater recharge quantity is approximately 8,412 AFY. The projected groundwater supply in the 2020 UWMP shows it decreasing to the estimated sustainable amount of 9,400 AFY. (Provost & Pritchard, 2021B). The overall water supply is met with an increase in surface and recycled water sources to offset the reduced use of groundwater resources.

The City has been searching for additional land to construct another dedicated groundwater recharge facility in the City. The facility will likely be in North Clovis upgradient of City wells. A minimum of 20 to 40 acres is desired with a minimum recharge capability of 1,500 to 3,000 AF per year. An additional project that the City is pursuing in cooperation with FID, FMFCD, and the City of Fresno, is either reoperation of Big Dry Creek Detention Basin, known as the Redbank-Fancher Creeks Flood Control Project, to allow storage of East Side Stream Flood releases or a project to increase recharge capabilities upstream of the Basin. This is currently in the study phase. (Provost & Pritchard, 2021B).

In addition, there are two banking facilities, the Waldron Banking Facilities (WBF) and Boswell Groundwater Banking Facility (BGBF), have been constructed in central Fresno County. The City entered into an agreement with the FID to participate in the financing of the construction of a dedicated water banking facility called the Waldron Banking Facilities. The City is entitled to receive up to ninety percent (9,000 AF) of the annual yield. The City plans on taking the water in dry years to augment supply. (Provost & Pritchard, 2021B).

The groundwater supplies the City relies upon are not adjudicated. The surface water supplies have either long-range contracts or newly executed contracts to document quantities and availability to the City. (Provost & Pritchard, 2021B).

Groundwater supply projections include approved developments outside of the City boundaries, but within the planning area, and estimated groundwater pumping by others within the planning area. The projected groundwater supply reliability does not account for groundwater pumping outside the City planning area, nor undocumented privately owned domestic or irrigation wells. Groundwater use may increase as population increases, and groundwater use by others (including school districts and agricultural users) may also increase in single dry years and multiple dry years (when surface water cutbacks occur).

The ’sustainable yield’ is defined as the amount of groundwater pumping that can occur while maintain groundwater at sustainable levels and avoiding undesirable results. The sustainable yield can be estimated as the total groundwater recharge (from natural and artificial sources) minus the groundwater outflow (as shown below). The GSP of the North Kings Groundwater Sustainability Agency indicates that the sustainable yield of the groundwater basin is approximately 1,140,000 AFY/acre (1,360,000 AF -220,000 AF).

With regards to the 2020 groundwater supply, as provided by the City’s UWMP, the City extracted 12,105 AF and conducted 5,316 AF of intentional recharge activities, which put the net extraction below the sustainable yield. It is presently understood that 9,400 AF per year can be sustainably used from the aquifer. (Provost & Pritchard, 2021B). The overall water supply is met with an increase in surface and recycled water sources to offset the reduced use of groundwater resources. Groundwater pumping accounted for 26 percent of the City’s total available water supply, but will be reduced over the planning horizon for the UWMP. The actual 2020 supply for the service area consisted of surface water, groundwater, supply water from storage and recycled water; the overall supply available to the City for 2020 was 53,748 AF. (Provost & Pritchard, 2021B). Future supply projections through 2040 are shown in Table 6-13.

TABLE 3.14-6: PROJECTED GROUNDWATER SUPPLY, AFY

	2020	*2025*	*2030*	*2035*	*2040*
Assumed Groundwater Supply	12,105	11,429	10,753	10,076	9,400

SOURCE: PROVOST & PRITCHARD, 2021B, TABLE 6-13.

REGULATORY SETTING

California Department of Health Services

The Department of Health Services, Division of Drinking Water and Environmental Management, oversees the Drinking Water Program. The Drinking Water Program regulates public water systems and certifies drinking water treatment and distribution operators. It provides support for small water systems and for improving their technical, managerial, and financial capacity. It provides subsidized funding for water system improvements under the State Revolving Fund (“SRF”) and Proposition 50 programs. The Drinking Water Program also oversees water recycling projects, permits water treatment devices, supports and promotes water system security, and oversees the Drinking Water Treatment and Research Fund for Methyl Tertiary Butyl Ether (MTBE) and other oxygenates.

California Code of Regulations

California Code of Regulations (CCR) Title 22, Chapter 15, Article 20 requires all public water systems to prepare a Consumer Confidence Report for distribution to its customers and to the Department of Health Services. The Consumer Confidence Report provides information regarding the quality of potable water provided by the water system. It includes information on the sources of the water, any detected contaminants in the water, the maximum contaminants levels set by regulation, violations and actions taken to correct them, and opportunities for public participation in decisions that may affect the quality of the water provided.

Urban Water Management Planning Act

The Urban Water Management Planning Act has as its objectives the management of urban water demands and the efficient use of urban water. Under its provisions, every urban water supplier is required to prepare and adopt an urban water management plan. An “urban water supplier” is a public or private water supplier that provides water for municipal purposes either directly or indirectly to more than 3,000 customers or supplying more than 3,000 acre-feet of water annually. The plan must identify and quantify the existing and planned sources of water available to the supplier, quantify the projected water use for a period of 20 years, and describe the supplier’s water demand management measures. The urban water supplier should make every effort to ensure the appropriate level of reliability in its water service is sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry years. The Department of Water Resources must receive a copy of an adopted urban water management plan.

Safe Drinking Water Act

The federal Safe Drinking Water Act, as passed in 1947 and amended in 1986 and 1996, is the Country's primary law regulating drinking water quality and is implemented by the United States Environmental Protection Agency (US EPA). The Safe Drinking Water Act authorizes the US EPA to set national health-based standards for drinking water and requires actions to protect drinking water and its sources. Additionally, it provides for treatment, monitoring, sampling, analytical methods, reporting, and public information requirements. Implementation of the Act, in California, is under the jurisdiction of the California Department of Public Health (CDPH), Division of Drinking Water and Environmental Management. Drinking Water regulations are set forth in the California Code of Regulations (CCR), Titles 7 and 22.

Water Conservation Projects Act

California's requirements for water conservation are codified in the Water Conservation Projects Act of 1985 (Water Code Sections 11950 – 11954).

Consistent with California Water Code Sections 11950 – 11954, the City has implemented various water conservation efforts, as well as a Water Shortage Contingency Plan that identifies actions that can be taken to respond to catastrophic interruption of water supply.

California Water Code

Water Code section 10910 states:

> *10910(c)(2) If the projected water demand associated with the proposed project was accounted for in the most recently adopted urban water management plan, the public water system may incorporate the requested information from the urban water management plan in preparing the elements of the assessment required to comply with subdivisions (d), (e), (f) and (g).*
>
> *10910(d)(1) The assessment required by this section shall include an identification of any existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed project, and a description of the quantities of water received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts.*
>
> *10910(d)(2) An identification of existing water supply entitlements, water rights, or water service contracts held by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall be demonstrated by providing information related to all of the following:*

> *(A) Written contracts or other proof of entitlement to an identified water supply.*
>
> *(B) Copies of a capital outlay program for financing the delivery of a water supply that has been adopted by the public water system.*
>
> *(C) Federal, state, and local permits for construction of necessary infrastructure associated with delivering the water supply.*
>
> *(D) Any necessary regulatory approvals that are required in order to be able to convey or deliver the water supply.*

> *10910(e) If no water has been received in prior years by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), under the existing water supply entitlements, water rights, or water service contracts, the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), shall also include in its water supply assessment pursuant to subdivision (c), an identification of the other public water systems or water service contract-holders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts, to the same source of water as the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has identified as a source of water supply within its water supply assessments.*

Additionally, Water Code section 10910 states:

> *10910(f) If a water supply for a proposed project includes groundwater, the following additional information shall be included in the water supply assessment.*
>
> *10910(f)(1) A review of any information contained in the urban water management plan relevant to the identified water supply for the proposed project.*
>
> *10910(f)(2) A description of any groundwater basin or basins from which the proposed project will be supplied. For those basins for which a court or the board has adjudicated the rights to pump groundwater, a copy of the order or decree adopted by the court or the board and a description of the amount of groundwater the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), has the legal right to pump under the order or decree. For basins that have not been adjudicated, information as to whether the department has identified the basin or basins as over drafted or has projected that the basin will become over drafted if present management conditions continue, in the most current bulletin of the department that characterizes the condition of the groundwater basin, and a detailed description by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), of the efforts being undertaken in the basin or basins to eliminate the long term overdraft condition.*

> *10910(f)(3) A detailed description and analysis of the amount and location of groundwater pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), for the past five years from any groundwater basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historical use records.*
>
> *A detailed description and analysis of the amount and location of groundwater that is projected to be pumped by the public water system, or the city or county if either is required to comply with this part pursuant to subdivision (b), from any basin from which the proposed project will be supplied. The description and analysis shall be based on information that is reasonably available, including, but not limited to, historical use records.*
>
> *10910(f)(4) An analysis of the sufficiency of the groundwater from the basin or basins from which the proposed project will be supplied to meet the projected water demand associated with the proposed project.*
>
> *A water assessment shall not be required to include the information required by this paragraph if the public water system determines, as part of the review required by paragraph (1), that the sufficiency of groundwater necessary to meet the initial and projected water demand associated with the project was addressed in the description and analysis required by paragraph (4) of subdivision (b) of Section 10631.*

Senate Bill (SB) 610

Senate Bill (SB) 610 was adopted in 2001 and reflects the growing awareness of the need to incorporate water supply and demand analysis at the earliest possible stage in the land use planning process. SB 610 amended the statutes of the Urban Water Management Planning Act, as well as the California Water Code Section 10910 et seq. The foundation document for compliance with SB 610 is the UWMP, which provides an important source of information for cities and counties as they update their general plans. Likewise, planning documents such as general plans and specific plans form the basis for the demand information contained in an UWMP, as well as a WSA required under SB 610.

Water Code Section 10910 (c)(4) states "If the city or county is required to comply with this part pursuant to subdivision (b), the water assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses, including agricultural and manufacturing uses."

Water supply planning under SB 610 requires reviewing and identifying adequate available water supplies necessary to meet the demand generated by a project, as well as the cumulative demand for the general region over the next 20 years, under a broad range of water conditions. This information is typically found in the current UWMP for the project area. SB 610 requires the identification of the public water supplier for a project.

In addition, SB 610 requires the preparation of a WSA if a project meets the definition of a “Project” under Water Code Section 10912 (a). The code defines a “Project” as meeting any of the following criteria:

- A proposed residential development of more than 500 dwelling units;
- A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space;
- A commercial building employing more than 1,000 persons or having more than 250,000 square feet of floor space;
- A hotel or motel with more than 500 rooms;
- A proposed industrial, manufacturing, or processing plant, or industrial park, planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area;
- A mixed-use project that includes one or more of these elements; or
- A project creating the equivalent demand of 500 residential units.

Alternately, if a public water system has less than 5,000 service connections, the definition of a “Project” includes any proposed residential, business, commercial, hotel or motel, or industrial development that would account for an increase of 10 percent or more in the number of service connections for the public water system.

Based on the following, SB 610 applies to the proposed Project:

1. The proposed Project is subject to CEQA and an EIR is required.
2. The proposed Project, with up to 605 proposed residential dwelling units, meets the definition of a “Project” as specified in Water Code section 10912(a) paragraph (1) as defined for residential development.

The proposed Project has not been the subject of a previously adopted WSA and has not been included in an adopted WSA for a larger project. Thus, a WSA, as required by these criteria under SB 610, has been prepared for the Project. The WSA is included in Appendix J of this EIR.

Senate Bill (SB) 221

SB 221 adds Government Code Section 66455.3, requiring that the local water agency be sent a copy of any proposed residential subdivision of more than 500 dwelling units within five days of the subdivision application being accepted as complete for processing by the city or county. It also adds Government Code Section 66473.7, establishing detailed requirements for establishing whether a “sufficient water supply” exists to support any proposed residential subdivisions of more than 500 dwellings, including any such subdivision involving a development agreement. When approving a qualifying subdivision tentative map, the city or county must include a condition requiring availability of a sufficient water supply. The applicable public water system must provide proof of availability. If there is no public water system, the city or county must undertake the analysis described in Government Code Section 66473.7. The analysis must include consideration of effects on other users of water and groundwater.

Executive Order B-37-16

In May 2016, Governor Edmund G. Brown, Junior, signed Executive Order B-37-16 (Executive Order), Making Water Conservation a California Way of Life. The Executive Order directed DWR to work with the State Water Resources Control Board (State Water Board) to develop new water use targets as part of a permanent conservation framework for urban water agencies. The targets will build upon requirements established in the 2009 Water Conservation Act, but will strengthen standards for indoor residential per capita water use, outdoor irrigation, commercial, industrial and institutional (CII) water use, and water lost through leaks. DWR will be establishing interim water use targets by 2018, with final standards to be published by 2021. Agencies will need to demonstrate progress towards achieving final compliance in 2025 (DWR, 2017).

City of Clovis General Plan

Policies: Land Use Element

- Policy 4.2 Surface water entitlements. The city should not approve annexation unless any and all surface water entitlements are retained; any and all surface water entitlements shall be transferred to the city upon development.

Policies: Public Facilities and Services Element

- Policy 1.1 New development. New development shall pay its fair share of public facility and infrastructure improvements.
- Policy 1.2 Water supply. Require that new development demonstrate contractual and actual sustainable water supplies adequate for the new development's demands.
- Policy 1.3 Annexation. Prior to annexation, the city must find that adequate water supply and service and wastewater treatment and disposal capacity can be provided for the proposed annexation. Existing water supplies must remain with the land and be transferred to the City upon annexation approval.
- Policy 1.4 Development-funded facilities. The City may require developments to install onsite or offsite facilities that are in excess of a development's fair share. However, the City shall establish a funding mechanism for future development to reimburse the original development for the amount in excess of the fair share costs.
- Policy 1.5 Recycled water. Use recycled water to reduce the demands for new water supplies. Support the expansion of recycled water infrastructure throughout Clovis and require new development to install recycled water infrastructure where feasible.
- Policy 1.6 Master plans. Periodically update water, recycled water, wastewater, and stormwater master plans and require all new development to be consistent with the current master plans.
- Policy 1.7 Groundwater. Stabilize groundwater levels by requiring that new development water demands not exceed the sustainable groundwater supply.

- Policy 1.8 Water facility protection. Protect existing and future water, wastewater, and recycled water facilities from encroachment by incompatible land uses that may be allowed through discretionary land use permits or changes in land use or zoning designations.

Policies: Open Space and Conservation Element

- Policy 3.5 Energy and water conservation. Encourage new development and substantial rehabilitation projects to exceed energy and water conservation and reduction standards set in the California Building Code.

City of Clovis Municipal Code

Municipal Code Chapter 3.10 Development Impact Fees, The purpose of this chapter is to establish a uniform set of procedures applicable to AB 1600 development impact fees that are adopted pursuant to the authority set forth in Government Code Section 66000 et seq. and the Municipal Code. These procedures are intended to apply to all AB 1600 development impact fees adopted by the City, regardless of whether there is an existing similar provision in the applicable chapter or section of the Municipal Code establishing the fee. If there is a conflict between this chapter and an existing similar provision in the applicable chapter or section of the Municipal Code establishing the fee, the provisions of this chapter shall control.

Chapter 6.5, Water System and Chapter 6.6, Wells, are contained within Title 6, Sanitation and Health. Chapter 6.5 contains five different articles that all pertain to specific aspects of the interconnected Water System the City and its residents rely on. Article 1 of Chapter 6.5 deals with Service Rates and Regulations; Article 2 discusses Main Extensions, Connections, and Frontage Chargers; Article 3 regulates Meters, Main Connections, and Laterals; Article 4 establishes rules for Heat Transfer Systems Utilizing Water; and Article 5 establishes Water Efficient Landscape Requirements. Chapter 6.6 regulates well drilling, prohibited acts, permits required, use requirements, recharge charges, and the use of drainage wells.

The City Municipal Code also contains Chapter 8.6, Plumbing Code. This Chapter adopts the California Plumbing Code and includes specific amendments.

Clovis Water Master Plan Update Phase III (2017)

The primary purpose of the Water Master Plan is to examine the feasibility of continued growth in the greater Clovis area from a water resource stand-point and develop a plan for implementation of facilities as well as development of a plan for acquisition of water supplies as the City continues to grow in an easterly direction with more limited groundwater supplies.

This report represents an update of the Phase 1 and 2 reports that were prepared in 1995 and 1999 respectively, that provided a blueprint for the future development of the city’s water system. This report documents the past years’ efforts in evaluating the existing system and developing the future plan for the system.

Clovis Wastewater Master Plan (2017)

The Clovis Wastewater Master Plan Update, Phase 3 was adopted in 2017. The wastewater master plan update process consisted generally of developing design criteria, defining wastewater service areas, developing wastewater flow projections, analyzing and designing collection system pipelines, and summarizing results. The Wastewater Master Plan Update, Phase 3, (2017 Master Plan) is the latest phase of an effort begun in 1995 to update the City's Wastewater Master Plan. The preceding phase, referred to as the Wastewater Master Plan Update, Phase 2, (2008 Master Plan) was documented in a final report dated June 30, 2008. Under the 2017 Master Plan, the core of the city is planned to discharge to regional trunk sewers and on to the Fresno-Clovis RWRF in southwest Fresno.

Clovis Recycled Water Master Plan (2017)

The City of Clovis released a Recycled Water Master Plan in 2017. This Plan demonstrates how the water systems in the City will accommodate future population growth. Due to the impact of a five-year drought throughout the state, the scarcity of water supplies has resulted in significant motivation to continue investment in the use of recycled water to meet water demands. The purpose of the Clovis Recycled Water Master Plan Update is to evaluate current recycled water use, identify additional market opportunities as defined in the adopted General Plan, and produce an implementation plan incorporating recycled water as a significant portion of the Clovis' water supply. The efficient use of surface water and groundwater resources is critical to maintaining sustainability of communities throughout the Central Valley. To help alleviate potable water demands placed on these supplies, recycled water is a key source of supply many communities, including Clovis, utilize to enhance management of local water resources.

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the proposed Project may have a significant impact on the environment associated with Utilities if it would:

- Require or result in the relocation or construction of new or expanded water facilities, the construction or relocation of which could cause significant environmental effects; and/or
- Have insufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years.

IMPACTS AND MITIGATION MEASURES

Impact 3.14-3: The proposed Project has the potential to require or result in the construction of new water treatment facilities or expansion of existing water facilities, the construction of which could cause significant environmental effects. (Less than Significant)

The Project area will be annexed to the City and will require an extension of existing potable and non-potable systems. The proposed water system will be located within the proposed public utilities easements and be connected to existing City mains and will comply with City Master Plans and standards. The City of Clovis provides water supplies to the City of Clovis. The City has three main water supply sources: groundwater, surface water, and recycled water. The City extracts groundwater from the Kings Subbasin. Surface water is delivered to the City by the Fresno Irrigation District (FID). The various surface water supplies are from the Kings River and Central Valley Project.

The City's ST-WRF produces tertiary treated effluent that can be used for agriculture or landscape irrigation.

POTABLE WATER SYSTEM

The Project Site would be served by a new potable water distribution system. The proposed water system will be located within the proposed public utilities easements and be connected to existing City mains and will comply with City Master Plans and standards. The proposed on-site water distribution system will have various points-of-connection to existing City mains. The Project will connect to the existing water main lines along nearby roadways. Additionally, an internal looped system of water lines will be installed within the Project Site.

NON-POTABLE WATER SYSTEM

The Project Site would include the development of an on-site non-potable water distribution system that would eventually provide irrigation water to planned parks, open space, and landscaped areas. This system will include a non-potable irrigation well which will be constructed by the project. All landscape irrigation is to be installed with non-potable components.

CONCLUSION

The proposed Project site will provide an adequate potable and non-potable water distribution systems in strict accordance with City Master Plans and standards. Furthermore, the construction of the new water facilities, which are associated with future buildout of the proposed Project, has the potential to cause environmental impacts. The potential for environmental impacts associated with the installation of the water system and all construction activities within the Development Area of the Project Site, are addressed throughout this EIR. There are no other anticipated impacts associated with the infrastructure construction activities beyond what is already discussed throughout this EIR. The installation of the water system infrastructure to serve the proposed Project would have a **less than significant** impact relative to this topic.

Impact 3.14-4: The proposed Project does not have the potential to have insufficient water supplies available to serve the Project and reasonably foreseeable future development during normal, dry and multiple dry years. (Less than Significant)

The Project site would be served by a new potable and non-potable water distribution system. The proposed water system will be located within the proposed public utilities easements and be connected to existing city mains and will comply with City Master Plans and standards. The City of Clovis provides water supplies to the City of Clovis. The City has three main water supply sources: groundwater, surface water, and recycled water. The City extracts groundwater from the Kings Subbasin. Surface water is delivered to the City by the Fresno Irrigation District (FID). The various surface water supplies are from the Kings River and Central Valley Project. The City's ST-WRF produces tertiary treated effluent that can be used for agriculture or landscape irrigation.

Proposed Project: The Project site is approximately 155 acres within 39 Assessor parcels (APNs). This includes the Development Area (77acres), and the Non-development Area (78 acres). The proposed Project includes an annexation of three APNs totaling approximately 77 acres; this includes the Development Area. The Tentative Subdivision Map would result in the subdivision of a total of approximately 77 acres into 605 single family residential units, with an additional 52 out lots for roads, utilities, greenspace, landscaping, and pedestrian paths. The Non-development area includes the parcels being annexed that will not be entitled for subdivision or development.

Projected Water Demand for the Proposed Project: As discussed above, water would be delivered to the Project via the City's existing and planned distribution system. The Project would receive water supply from the City's water distribution system, which relies on both groundwater and surface water supplies. According to the Water Supply Assessment prepared for the proposed Project, the proposed Project has an associated Land Use-based Water Demand Factor (WDF of 3.3 AFY/acre associated with Medium High Density Residential (MHDR) based on the City's UWMP. The projected water demand for the proposed Project is shown in Table 3.14-7. The total projected annual potable water demand for the Project is projected to be 255.8 AFY.

TABLE 3.14-7: PROJECTED WATER DEMAND FOR BUILDOUT OF THE PROPOSED PROJECT

LAND USE	UNIT FACTOR	ACREAGE	WATER DEMAND (AFY)
Medium High Density Residential (MHDR)	3.3	77.5	255.8
Total	**--**	**77.5**	**255.8**

NOTES: BASED ON LAND USE-BASED WATER DEMAND FACTOR (WDF) OF 0.7 AFY/ACRE. AFY = ACRE-FEET PER YEAR.

SOURCE: TRACT 6205, NORTHWEST SPHERE OF INFLUENCE EXPANSION AREA. WATER SUPPLY ASSESSMENT (PROVOST & PRITCHARD CONSULTING GROUP, 2022).

As shown in table 3.14-7, the total proposed water demand amounts to approximately 1.6% of the excess supply for year 2030 the City has in a normal year as shown in Table ES-3 of the 2020 UWMP. This indicates an ability of the City to serve this project in the interim while additional supplies are acquired to accommodate full build-out of the GP.

Projected Water Supply for the Proposed Project: Water demands for the proposed Project will be served using the City's existing and future portfolio of water supplies. The inclusion of existing and planned future supplies is specifically allowed by the Water Code:

> *Water Code section 10631(b): Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a).*

The applicants for the proposed Project will provide their proportionate share of required funding to the City for the acquisition and delivery of treated potable water supplies to the Project site.

Determination of Water Supply Sufficiency Based on the Requirements of SB 610: Water Code section 10910 states:

> *10910(c)(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.*

Pursuant to Water Code section 10910(c)(4) and based on the technical analyses described in the UWMP, the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project as shown in table 3.14-7, in addition to existing and planned future uses.

A comparison of the City's projected potable and raw water supplies and demands is shown in Table 3.14-8 for Normal, Single Dry, and Multiple Dry Years. Demand within the City's service area is not expected to exceed the City's supplies in any Normal year between 2020 and 2040. From this analysis, the City's water demands are not expected to exceed water supplies in Single Dry Years or Multiple Dry Years.

TABLE 3.14-8: SUMMARY OF POTABLE AND RAW WATER DEMAND VERSUS SUPPLY DURING HYDROLOGIC NORMAL, SINGLE DRY, AND MULTIPLE DRY YEARS

Hydrologic Condition		*Supply and Demand Comparison, AFY*			
		2025	*2030*	*2035*	*2040*
Normal Year					
Available Potable and Raw Water Supply		50,739	58,937	65,034	74,650
Total Water Demand		39,737	42,824	46,422	52,598
Potential Surplus (Deficit)		11,002	16,113	18,612	22,052
Supply Shortfall, Percent of Demand		-	-	-	-
Single Dry Year					
Available Potable and Raw Water Supply		37,839	43,587	47,233	53,109
Total Water Demand		34,272	37,359	40,957	47,133
Potential Surplus (Deficit)		3,567	6,228	6,276	5,976
Supply Shortfall, Percent of Demand		-	-	-	-
Multiple Dry Year					
Multiple Dry Year 1	Available Potable and Raw Water Supply	46,784	54,607	60,330	68,999
	Total Water Demand	36,489	39,422	42,840	48,707
	Potential Surplus (Deficit)	10,294	15,185	17,489	20,292
	Supply Shortfall, Percent of Demand	-	-	-	-
Multiple Dry Year 2	Available Potable and Raw Water Supply	45,093	52,576	57,958	66,095
	Total Water Demand	34,183	36,962	40,200	45,758
	Potential Surplus (Deficit)	**10,910**	**15,614**	**17,758**	**20,337**
	Supply Shortfall, Percent of Demand	-	-	-	-
Multiple Dry Year 3	Available Potable and Raw Water Supply	41,895	48,310	52,625	59,717
	Total Water Demand	31,346	33,969	37,028	42,277
	Potential Surplus (Deficit)	10,550	14,341	15,597	17,440
	Supply Shortfall, Percent of Demand	-	-	-	-
	Available Potable and Raw Water Supply	37,839	43,587	47,233	53,109
	Total Water Demand	28,005	30,474	33,353	38,293

Multiple Dry Year 4	Potential Surplus (Deficit)	9,834	13,112	13,881	14,815
	Supply Shortfall, Percent of Demand	-	-	-	-
Multiple Dry Year 5	Available Potable and Raw Water Supply	49,743	57,992	64,141	73,716
	Total Water Demand	37,825	40,758	44,176	50,043
	Potential Surplus (Deficit)	11,918	17,235	19,965	23,674
	Supply Shortfall, Percent of Demand	-	-	-	-

SOURCE: PROVOST & PRITCHARD, 2021B.

CONCLUSION

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The proposed Project would not result in insufficient water supplies available to serve the Project from existing entitlements and resources. Therefore, the proposed Project would result in a **less than significant** impact to water supplies.

3.14.3 STORMWATER

ENVIRONMENTAL SETTING

Stormwater throughout the City of Clovis is collected in Fresno Metropolitan Flood Control District's (FMFCD) basins. Unless the storm season is particularly wet, the collected stormwater is allowed to percolate into the soil as groundwater recharge. Additionally, the FMFCD allows the City to utilize 17 stormwater basins throughout the City's Service Area for recharge purposes. (Provost & Pritchard, 2021B).

FMFCD covers the entire Fresno/Clovis Metropolitan Area and is authorized to control storm waters within an urban and rural foothill watershed of approximately 400 square miles, known as the Fresno County Stream Group. The FMFCD provides storm drainage through a system of inlets, drainage pipes, drainage ponds, and a system of dams and channels upstream. This system provides the primary means of urban storm drainage control for the City of Clovis and its sphere of influence. New storm drainage improvements are made by either development fees or by formation of assessment or improvement districts. The City of Clovis has a representative on the FMFCD Board. (City of Clovis, 2014).

On September 16, 1994, the Central Valley Regional Water Quality Control Board (Regional Water Board) issued the first municipal separate storm sewer system (MS4) National Pollutant Discharge Elimination System (NPDES) permit No. CA0083500 to the Fresno Metropolitan Flood Control District (District) and four other Co-Permittees, including the City of Clovis. The Regional Water Board renewed the permit on May 31, 2013 (Order No. R5-2013-0080). (FMFCD, 2020).

The FMFCD operates and maintains all master plan improvements, including the retention basins. The City is responsible for operation and maintenance of all temporary facilities where master plan improvements are not complete. The City is also responsible for all surface flooding in streets and other areas where storm water cannot reach inlets and pipes quickly enough. Storm drainage collection facilities are designed for two-year storm capacity. Storm drain retention basins are designed for 50-year storm frequency. Development impact fees finance acquisition and construction of ponding basins. Storm drainage improvement districts fund development of storm drainage systems for existing urban areas. (City of Clovis, 2014).

Clovis is traversed by three natural stream systems. Each of these systems consists of sub streams or creeks that collect together to discharge to a centralized natural drainage channel. These systems are the Red Bank, Fancher, and Dog Creek System; the Dry and Dog Creek System; and the Pup Creek/Alluvial Drain System. The latter is a tributary of the original Dry Creek channel. These stream systems collect storm runoff from the foothills east of Clovis and convey such runoff through the Clovis/Fresno metropolitan areas to the Fresno Slough, which is located west of the City of Fresno. (County of Fresno, 2018).

The City's Public Utilities Department has three Stormwater Patrol teams, made up of 22 public utilities employees, to implement emergency flood control measures. The plan contains information and procedures to rapidly address flooding throughout the City. Contact information and team assignment data is updated regularly as are geographic locations subject to flooding. Appendices include suppliers/contractors, storm basin list, problem drain lists, and partnerships and agencies with shared responsibility for storm preparedness, mitigation, and response. (County of Fresno, 2018).

Existing City Stormwater and Flood Control Facilities

Flood protection in Clovis is afforded by Big Dry Creek Dam on Dry Creek. Big Dry Creek Dam is located approximately 3.5 miles upstream of the City of Clovis. Its main purpose is flood control, and it has a storage capacity of 16,250 acre-feet. Big Dry Creek Reservoir has prevented an estimated $15 million in damage in the Fresno-Clovis area since its completion in 1948. (County of Fresno, 2018).

The Big Dry Creek Dam impounds stormwater runoff from Big Dry Creek in the Big Dry Creek Reservoir. The Big Dry Creek Reservoir is owned and operated by the FMFCD and is intended primarily for flood control of winter runoff from the Dry Creek and Dog Creek watersheds. In the 1990s, modifications were made to increase the capacity of the reservoir, and it now provides protection against the 200-year flood. (County of Fresno, 2018).

Under wet conditions, the Big Dry Creek Reservoir captures runoff and controls releases into artificial ditches and canals, which drain into either Little Dry Creek, located north of the reservoir, or in a southerly direction into Mill Ditch. Flows from Little Dry Creek and Mill Ditch eventually drain to the San Joaquin River. Flows from the reservoir can also be diverted into Dog Creek, which also eventually drains into the San Joaquin River. During dry weather conditions, the reservoir does not discharge water and is normally empty, with the exception of a 156-acre-foot residual pool. The top of the pool remains below the elevation of an existing discharge gate. (County of Fresno, 2018).

Further, on average, FMFCD’s regional stormwater basin system captures 92 percent of annual rainfall, of which, 70-85 percent of the captured stormwater runoff is recharged into the local groundwater aquifer. The stormwater basins also remove 50-80 percent of the typical stormwater pollutants. (FMFCD, 2020).

Mitigation activities continue to be done in accordance with applicable state and federal requirements for floodplain management and in coordination with the FMFCD. Additional mitigation measures for critical infrastructure protection and rehabilitation are done through the City’s Capital Improvement Project (CIP) budget. To date, those mitigation projects have included fire station security, water/sewer infrastructure improvements and City Hall building rehabilitation. (County of Fresno, 2018).

Future Stormwater Drainage Demand and System Improvements

The 2016 Storm Fresno Metropolitan Flood Control District (FMFCD) Services Plan provides a comprehensive planning document to guide improvement and expansion of the City’s storm drainage system to meet current and future needs in a safe and reliable manner while maintaining compliance with all applicable regulations.

The FMFCD has finalized the design of the Dry Creek Extension Basin located near Brawley and Annadale Avenues. This will be a rural flood control basin located southwest of the City of Fresno. It will provide storage for floodwaters flowing through Dry Creek and other canals, which will provide groundwater recharge benefits. The initial design of the basin was for a 20-acre basin site which is fully excavated. The FMFCD added an adjacent 23-acre site to provide additional storage. This basin is being constructed by the District and is not part of the Federal Redbank and Fancher Creeks Project. (FMFCD, 2017).

The FMFCD has identified four primary groups of construction projects: (1) the Redbank-Fancher Creeks Flood Control Project; (2) District LCA enhancement projects; (3) new development projects; and (4) other routine District maintenance and construction projects. (FMFCD, 2017).

The Corps' Redbank-Fancher Creeks Project, completed in the summer of 1993, provides the points of control for the flows that will pass through the rural streams storm and flood conveyance system. Under the LCA with the Corps, the FMFCD is obligated to ensure proper functioning of the Redbank Fancher Creeks Project components. Through implementation of the rural streams program, the FMFCD will improve conveyance capacities of existing channels where necessary, restore obstructed and eradicated channels, and once adequate capacity is achieved, maintain appropriate project conveyance capabilities. These efforts will involve close coordination with private property owners and developers to obtain necessary channel easement dedications. These dedications preserve flooding rights-of-way and allow District access to the stream channels for operation and maintenance. (FMFCD, 2017).

As future development needs warrant, local drainage facilities will be added to augment the flood control facilities. The FMFCD will review new development plans to ensure appropriate design of channels according to the Rural Streams Design Manual, which is currently being developed by the District. Other routine District activities include construction, repair, and maintenance of flood control structures throughout the rural streams/flood control system. (FMFCD, 2017).

REGULATORY SETTING

Clean Water Act

The Clean Water Act (CWA) regulates the water quality of all discharges into waters of the United States including wetlands, perennial and intermittent stream channels. Section 401, Title 33, Section 1341 of the CWA sets forth water quality certification requirements for "any applicant applying for a federal license or permit to conduct any activity including, but not limited to, the construction or operation of facilities, which may result in any discharge into the navigable waters." Section 404, Title 33, Section 1344 of the CWA in part authorizes the U.S. Army Corps of Engineers to:

- Set requirements and standards pertaining to such discharges: subparagraph (e); Issue permits "for the discharge of dredged or fill material into the navigable waters at specified disposal sites": subparagraph (a);
- Specify the disposal sites for such permits: subparagraph (b);

- Deny or restrict the use of specified disposal sites if "the discharge of such materials into such area will have an unacceptable adverse effect on municipal water supplies and fishery areas": subparagraph (c);
- Specify type of and conditions for non-prohibited discharges: subparagraph (f);
- Provide for individual State or interstate compact administration of general permit programs: subparagraphs (g), (h), and (j);
- Withdraw approval of such State or interstate permit programs: subparagraph (i);
- Ensure public availability of permits and permit applications: subparagraph (o);
- Exempt certain Federal or State projects from regulation under this Section: subparagraph (r); and,
- Determine conditions and penalties for violation of permit conditions or limitations: subparagraph (s).
- Section 401 certification is required prior to final issuance of Section 404 permits from the U.S. Army Corps of Engineers.

The California State Water Resources Control Board and RWQCBs enforce State of California statutes that are equivalent to or more stringent than the Federal statutes. RWQCBs are responsible for establishing water quality standards and objectives that protect the beneficial uses of various waters including the San Joaquin River, and other waters in the surrounding area. In the city the RWQCB is responsible for protecting surface and groundwater from both point and non-point sources of pollution. Water quality objectives for all of the water bodies within the City were established by the RWQCB and are listed in its Basin Plan.

National Pollutant Discharge Elimination System

National Pollutant Discharge Elimination System (NPDES) permits are required for discharges of pollutants to navigable waters of the United States, which includes any discharge to surface waters, including lakes, rivers, streams, bays, the ocean, dry stream beds, wetlands, and storm sewers that are tributary to any surface water body. NPDES permits are issued under the Federal Clean Water Act, Title IV, Permits and Licenses, Section 402 (33 USC 466 et seq.)

The RWQCB issues these permits in lieu of direct issuance by the Environmental Protection Agency, subject to review and approval by the Environmental Protection Agency Regional Administrator. The terms of these NPDES permits implement pertinent provisions of the Federal Clean Water Act and the Act's implementing regulations, including pre-treatment, sludge management, effluent limitations for specific industries, and anti- degradation. In general, the discharge of pollutants is to be eliminated or reduced as much as practicable so as to achieve the Clean Water Act's goal of "fishable and swimmable" navigable (surface) waters. Technically, all NPDES permits issued by the RWQCB are also Waste Discharge Requirements issued under the authority of the CWA.

These NPDES permits regulate discharges from publicly owned treatment works, industrial discharges, stormwater runoff, dewatering operations, and groundwater cleanup discharges. NPDES permits are issued for five years or less and are therefore to be updated regularly. The rapid and dramatic population and urban growth in the Central Valley Region has caused a significant increase in NPDES permit applications for new waste discharges. To expedite the permit issuance process, the SWRCB has adopted several general NPDES permits, each of which regulates numerous discharges of similar types of wastes. The SWRCB has issued general permits for stormwater runoff from industrial and construction sites statewide. Stormwater discharges from industrial and construction activities in the Central Valley Region can be covered under these general permits, which are administered jointly by the SWRCB and RWQCB.

Federal Emergency Management Agency

Fresno County is a participant in the National Flood Insurance Program (NFIP), a federal program administered by FEMA. Participants in the NFIP must satisfy certain mandated floodplain management criteria. The National Flood Insurance Act of 1968 has adopted as a desired level of protection, an expectation that developments should be protected from floodwater damage of the Intermediate Regional Flood (IRF). The IRF is defined as a flood that has an average frequency of occurrence on the order of once in 100 years, although such a flood may occur in any given year. Communities are occasionally audited by the Department of Water Resources to insure the proper implementation of FEMA floodplain management regulations.

Department of Water Resources

The Department of Water Resources' (DWR) major responsibilities include preparing and updating the California Water Plan to guide development and management of the State's water resources, planning, designing, constructing, operating, and maintaining the State Water Resources Development System, protecting and restoring the Sacramento-San Joaquin Delta, regulating dams, providing flood protection, assisting in emergency management to safeguard life and property, educating the public, and serving local water needs by providing technical assistance. In addition, the DWR cooperates with local agencies on water resources investigations; supports watershed and river restoration programs; encourages water conservation; explores conjunctive use of ground and surface water; facilitates voluntary water transfers; and, when needed, operates a State drought water bank.

California Water Code

California's primary statute governing water quality and water pollution issues with respect to both surface waters and groundwater is the Porter-Cologne Water Quality Control Act of 1970 (Division 7 of the California Water Code) (Porter-Cologne Act). The Porter-Cologne Act grants the State Water Resource Control Board (SWRCB) and each of the RWQCBs power to protect water quality, and is the primary vehicle for implementation of California's responsibilities under the Federal Clean Water Act. The Porter-Cologne Act grants the SWRCB and the RWQCBs authority and responsibility to adopt plans and policies, to regulate discharges to surface and groundwater, to regulate waste disposal sites and to require cleanup of discharges of hazardous materials and other pollutants. The Porter-Cologne Act also establishes reporting requirements for unintended discharges of any hazardous substance, sewage, or oil or petroleum product.

Each RWQCB must formulate and adopt a water quality control plan (Basin Plan) for its region the regional plans are to conform to the policies set forth in the Porter-Cologne Act and established by the SWRCB in its State water policy. The Porter-Cologne Act also provides that a RWQCB may include within its regional plan water discharge prohibitions applicable to particular conditions, areas, or types of waste.

The Water Code Section 13260 requires all dischargers of waste that may affect water quality in waters of the state to prepare and provide a water quality discharge report to the RWQCB. Section 13260a-c is as follows:

> (a) Each of the following persons shall file with the appropriate regional board a report of the discharge, containing the information that may be required by the regional board:
>
> > (1) A person discharging waste, or proposing to discharge waste, within any region that could affect the quality of the waters of the state, other than into a community sewer system.
> >
> > (2) A person who is a citizen, domiciliary, or political agency or entity of this state discharging waste, or proposing to discharge waste, outside the boundaries of the state in a manner that could affect the quality of the waters of the state within any region.
> >
> > (3) A person operating, or proposing to construct, an injection well.
>
> (b) No report of waste discharge need be filed pursuant to subdivision (a) if the requirement is waived pursuant to Section 13269.
>
> (c) Each person subject to subdivision (a) shall file with the appropriate regional board a report of waste discharge relative to any material change or proposed change in the character, location, or volume of the discharge.

State Water Resource Control Board (State Water Board) Stormwater Strategy

The Stormwater Strategy is founded on the results of the Stormwater Strategic Initiative, which served to direct the State Water Board’s role in Stormwater resources management. The Stormwater Strategy developed guiding principles to serve as the foundation of the Stormwater program; identified issues that support or inhibit the program from aligning with the guiding principles; and proposed and prioritized projects that the Water Boards could implement to address those issues. The State Water Board staff created a strategy-based document called the Strategy to Optimize Management of Stormwater (STORMS). STORMS includes a program vision, missions, goals, objectives, projects, timelines, and consideration of the most effective integration of project outcomes into the Water Board’s Stormwater Program.

Stormwater Quality

The State Water Board adopted Order No. 2013-0001-DWQ in 2013, which requires that agencies regulate post-construction development (Provision E.12) through a number of different program elements. In response to this order, several permittees, including Clovis, and Fresno County collaborated together to develop the Fresno-Clovis Storm Water Quality Management Program, dated November 2013.

Fresno-Clovis Storm Water Quality Management Program (2013)

The Storm Water Quality Management Program (SWQMP) was developed pursuant to Order No. R5-2013-0080. The municipal NPDES stormwater permit (MS4 Permit) was issued to the Fresno Metropolitan Flood Control District (District), the cities of Fresno and Clovis, the County of Fresno (County), and the California State University at Fresno (CSUF) by the Central Valley Regional Water Quality Control Board (Regional Board) on May 31, 2013. The SWQMP represents the five-year management strategy for controlling the discharge of pollutants in stormwater and urban runoff from the Fresno-Clovis metropolitan area to the during the third Permit term (2013-2018).

The SWQMP includes specific pollution prevention and control practices for Fresno-Clovis urban drainage system planning, design, construction, and maintenance. The Program also includes public education to prevent stormwater pollution; specifies construction, industrial/commercial, municipal, and new development control practices; procedures to prevent and respond to illicit discharges and connections; monitoring to assess stormwater impacts on receiving waters; and program effectiveness assessments (PEA) to evaluate the effectiveness of best management practices (BMPs).

To address the core program objectives and targeted stormwater pollutants and to ensure compliance with MS4 Permit requirements, the SWQMP incorporates a series of control measures, performance standards, and implementation schedules that provide for a long-term, comprehensive, and multidisciplinary effort by the Permittees to continue to achieve water quality standards and protect beneficial uses of the San Joaquin River, creeks and canals.

Water Quality Control Plan for the Central Valley Region

The Water Quality Control Plan for the Central Valley Region (Basin Plan) includes a summary of beneficial water uses, water quality objectives needed to protect the identified beneficial uses, and implementation measures. The Basin Plan establishes water quality standards for all the ground and surface waters of the region. The term “water quality standards,” as used in the Federal Clean Water Act, includes both the beneficial uses of specific water bodies and the levels of quality that must be met and maintained to protect those uses. The Basin Plan includes an implementation plan describing the actions by the RWQCB and others that are necessary to achieve and maintain the water quality standards.

The RWQCB regulates waste discharges to minimize and control their effects on the quality of the region’s ground and surface water. Permits are issued under a number of programs and authorities. The terms and conditions of these discharge permits are enforced through a variety of technical, administrative, and legal means. Water quality problems in the region are listed in the Basin Plan, along with the causes, where they are known. For water bodies with quality below the levels necessary to allow all the beneficial uses of the water to be met, plans for improving water quality are included. The Basin Plan reflects, incorporates, and implements applicable portions of a number of national and statewide water quality plans and policies, including the California Water Code and the Clean Water Act.

City of Clovis General Plan

Policies: Public Facilities & Services Element

- Policy 1.6 Master plans. Periodically update water, recycled water, wastewater, and stormwater master plans and require all new development to be consistent with the current master plans.

Policies: Environmental Health Element

- Policy 1.1 Flood zone. Prohibit development within the 100-year flood zone and dam inundation areas unless adequate mitigation is provided against flood hazards. Participate in the National Flood Insurance Program.

Policies: Open Space & Conservation Element

- Policy 3.1 Stormwater management. Encourage the use of low impact development techniques that retain or mimic natural features for stormwater management.
- Policy 3.2 Stormwater pollution. Minimize the use of non-point source pollutants and stormwater runoff.
- Policy 3.3 Well water. Prohibit the use of new private wells in new development.

City of Clovis Municipal Code

The purpose and intent of Chapter 6.7, Urban Storm Water Quality Management and Discharge Control, is to ensure the health, safety, and general welfare of citizens, and protect and enhance the water quality of watercourses and water bodies in a manner pursuant to and consistent with the federal Clean Water Act (33 U.S.C. Section 1251 et seq.) by reducing pollutants in urban storm water discharges to the maximum extent practicable and by effectively prohibiting non-storm water discharges to the storm drain system.

Chapter 8.7, Planned Local Drainage Facilities and Improvements Development Requirements, Financing Mechanisms and Fees, was established due to the finding that the development of land substantially accelerates the concentration of surface and storm waters and that it is necessary to provide for the construction of and establish, and collect, fees to defray all or a part of the actual or the estimated cost of constructing planned local drainage facilities for the control and safe disposal of surface and storm waters from local drainage areas in order to promote and protect the public safety, peace, comfort, and convenience and the general welfare. Further, the Municipal Code also contains Chapter 8.12, Floodplain Management, which aims to promote the public health, safety, and general welfare of its citizenry through adequate floodplain and flood hazard management and mitigation.

Chapter 8.12 provides for floodplain management and regulates development in floodplains. A development permit must be obtained before construction or development within any area of special flood hazard. Permits require provisions for flood hazard reduction, including anchoring, flood-resistant materials, and construction methods to floodproof the structure.

Chapter 9.110 provides subdivision design and improvement requirements. Per Section 9.110.040, a grading plan is required to be submitted to and approved by the City Engineer prior to issuance of a subdivision-level building permit. Subdivisions are required to incorporate appropriate erosion and sediment control measures.

Chapter 9.28 contains landscaping standards and requires a landscape design plan, irrigation design plan, and soil analysis in order to reduce runoff and control soil erosion as part of the landscape documentation package.

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the proposed Project may have a significant impact on the environment associated with Utilities if it would:

- Require or result in the relocation or construction of new or expanded stormwater drainage facilities, the construction or relocation of which could cause significant environmental effects.

IMPACTS AND MITIGATION MEASURES

Impact 3.14-5: The proposed Project has the potential to require or result in the construction of new stormwater drainage facilities, the construction of which could cause significant environmental effects. (Less than Significant)

Flooding events can result in damage to structures, injury or loss of human and animal life, exposure of waterborne diseases, and damage to infrastructure. In addition, standing floodwater can destroy agricultural crops, undermine infrastructure and structural foundations, and contaminate groundwater.

As shown on Figure 3.9-2, the majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

Flooding events can result in damage to structures, injury or loss of human and animal life, exposure of waterborne diseases, and damage to infrastructure. In addition, standing floodwater can destroy agricultural crops, undermine infrastructure and structural foundations, and contaminate groundwater.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be **less than significant** and no new structures would be constructed within the 100-year flood plain.

The proposed stormwater collection system functions through storm drainage collection, treatment and discharge. The exact sizing of the underground piping will be engineered during the preparation of the improvement plans, which will be in coordination with FMFCD. The proposed storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB) and City of Clovis regulations; Phase II, National Pollutant Discharge Elimination System (NPDES) Permit Requirements; NPDES-MS4 Permit Requirements; and LID Guidelines.

FMFCD will require lot coverage to be provided prior to submittal of improvement plans. The lot coverage is calculated by the District to include the front yard walkway, sidewalk walkway and the rear yard patio equaling an additional 6% of impervious area in addition to the City’s typical lot coverage calculation. This calculation cannot be calculated at this time given that building plans and lot specific landscaping and site improvements have not been prepared. This very detailed level of design would be performed at either the improvement plan or building plan phase of the project. Ultimately, FMFCD charges a drainage fee that is calculated commensurate with the lot coverage calculation.

FMFCD reviews all grading and improvement plans for consistency with the FMFCD Master Plan. This review ensures that grading does not have an adverse impact to major storm conveyance and to the passage of storm water to the adjacent roadways and existing storm drainage pipelines and inlets. They require all projects to provide the appropriate surface flowage easements or covenants for any portion of the development area that cannot convey storm water to the public right-of-way without crossing private property.

The initial review by FMFCD has indicated that the “Development Area” is currently located within FMFCD’s adopted Rural Master Plan Drainage Area “BY1.” The adopted Rural Master Plan drainage system is designed to serve the existing land uses of open space, range/pasture and rural residential housing densities ranging from 0 to 0.7 dwelling unit/acre (du/ac). FMFCD has indicated that the existing planned drainage facilities do not have capacity to serve the proposed higher urban density residential land use. FMFCD has indicated that the “Development Area” is required to mitigate the impacts of the increased runoff from the proposed higher density residential land use to the adopted rural planned rate. FMFCD indicated that the “Development Area” may either make improvements to the existing pipeline system to provide additional capacity or may use some type of onsite permanent peak reducing facility in order to match the adopted Rural Master Plan flow rates and eliminate any adverse impacts on the downstream drainage system. FMFCD requested that the grading Engineer contact the District as early as possible to review the proposed site grading for verification and acceptance of design prior to preparing a grading plan.

FMFCD noted that the construction of the Optional Master Plan Facilities and Optional Non-Master Plan Facilities (as shown on Exhibit No. 1 of their letter), will provide permanent drainage service to the portion of the “Development Area” located north of Heirloom Avenue. The construction of the Optional Non-Master Plan Facilities, as shown on Exhibit No. 1, will provide permanent drainage service to the portion of the “Development Area” located south of Heirloom Avenue upon construction of facilities by in Tracts 6292 and 6344. If these optional facilities are not constructed, FMFCD recommends temporary facilities until permanent service is available.

FMFCD noted that the “Development Area” shall not block the historical drainage patterns of existing homes located within the parcels to the east and west side of the “Development Area.” The “Development Area” shall verify to the satisfaction of FMFCD that runoff from these areas has the ability to surface drain to adjacent streets or be collected into PER-3, as shown on Exhibit No. 1. Either a stub street, channel, or a combination of both shall be provided for those areas, as shown on Exhibit No. 1.

FMFCD noted that the “Development Area” must identify what streets will pass the major storm and provide calculations that show structures will have adequate flood protection. Based on historical drainage patterns, some of the streets located within the “Development Area” may need to be resized or reconfigured (including, but not limited to, streets that include traffic calming curbs) to pass larger event storms. FMFCD approval is not extended to street configuration. A drainage report indicating the path of the major storm flow and calculations confirming there is adequate protection of finished floors will be necessary.

Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD’s stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD’s requirements, the proposed Project would have a **less than significant** impact relative to this topic.

3.14.4 SOLID WASTE

ENVIRONMENTAL SETTING

The City Solid Waste Division coordinates the collection and disposal of solid waste generated by residential and commercial customers located within the City of Clovis. Private vendors, under City contract, collect waste from select commercial customers and recyclables and yard wastes from residential customers. (City of Clovis, 2014).

The City Solid Waste Division conducts all operations necessary to landfill City refuse in accordance with county, state, and federal requirements. The Clovis landfill is an active Class III landfill which accepts municipal solid waste that is currently permitted through the year 2066.

Community Cleanup Program provides single-family residents with a semiannual curbside removal of up to six cubic yards of non-hazardous residential waste. Eligible residents are permitted to place waste to be removed in front of the curb to their residence two weeks prior to their scheduled pick-up day. The program contributes to an overall cleaner community and discourages illegal dumping. (City of Clovis, 2014).

Waste Collection Services

The City of Clovis Public Utilities Department, and Solid Waste Division, oversee solid waste collection services for the Clovis area. Recycling and greenwaste collection in the City of Clovis is provided by a contract service with Republic Services. The Public Utilities Department works to meet commercial and residential demands in a low cost and environmentally conscious manor. The City of Clovis employs the “single stream” method of recycling in which all recyclable material (other than green waste) goes into the blue Recycling toter. (City of Clovis, 2022).

Waste Disposal Facilities

The City of Clovis is serviced by several landfills, but primarily by the City of Clovis Landfill and the American Avenue Disposal Site. In 2019, California Department of Resources Recycling and Recovery reports that the Clovis Landfill handled over 63,500 tons of waste, and the American Avenue Disposal Site saw over 11,500 tons of waste. (Cal Recycle, 2019).

CLOVIS LANDFILL

The Clovis Landfill is located at 15679 Auberry Road. The landfill has been in commission for several decades, and is consistently maintained by the City, and by BSK Associates; the City partners with BSK Associates to perform service tests that monitor landfill operations and impacts.

BSK’s environmental and geotechnical engineering services to the City at the Clovis Landfill date back to the mid-1970s with the preparation of a Landfill Master Plan, Design, Drainage, Liners and Seepage Control. Subsequent services included the installation of groundwater and soil gas monitoring network, monitoring identified releases of volatile organic compounds and the Evaluation Monitoring Program (EMP) was developed and implemented to investigate the extent of the problem. The site hydrogeology is complex; groundwater containing VOCs was found in fractured bedrock, metamorphic rock, decomposed metamorphic rock and alluvium. A creek at the base of the landfill effectively acts as a boundary to horizontal migration of VOCs. The extent of VOCs in groundwater has been defined. (BSK, 2022).

Additional issues confronting the City included excessive levels of methane at the landfill boundary, limited air space (active life) and shortage of cover material. To address these issues, BSK recommended in 1996 that a feasibility study be performed to evaluate the viability of reconstructing the unlined portion of the landfill (comprising about 20 acres with 2.5 million cubic yards of landfill materials). The feasibility study concluded that reconstruction would generate sufficient materials for daily cover needs, add an additional 15 years to the active life, and address landfill releases to groundwater through source elimination. Subsequent monitoring has identified concurrent declines in groundwater VOCs and in landfill gas methane concentrations. The landfill reclamation was completed in 2010 and extended the useful life of the landfill by an estimated 35 years. (BSK, 2022).

BSK currently performs the following Detection and Correction Action Monitoring Program tasks at the Clovis Landfill:

- Monthly sampling of landfill leachate
- Quarterly perimeter screening of methane monitoring wells
- Quarterly water level measurements
- Semi-annual groundwater monitoring
- Semi-annual monitoring of pan lysimeters/vadose zone
- Surface water sampling
- Preparation of Semi-Annual Monitoring Reports
- Five-Year Sampling for groundwater, leachate, and surface water
- Installation of groundwater monitoring wells

BSK also has provided the following services to Clovis Landfill:

- Evaluation Monitoring Program
- Sampling and Analysis Plan
- Non-Water Release Corrective Action Plan
- Water Release Corrective Action Financial Assurance Plan
- Subsurface Drainage Collection Design Consultation and Construction Oversight
- Liner Construction Earthwork Observation and Field Testing
- Geologic and Hydrogeologic Investigations
- Storm Water Pollution Prevention Plans
- Investigations of Subsurface Drainage Discharge Treatment and Reuse
- Soil Gas Monitoring Well Destruction

(BSK, 2022).

Solid Waste Generation Rates and Volumes

The California Department of Resources Recycling and Recovery (CalRecycle) tracks and monitors solid waste generation rates on a per capita basis. Per capita solid waste generation rates and total annual solid waste disposal volumes for the City of Clovis between 2010 and 2020 are shown in Table 3.14-9. As shown, the per capita waste generation rate decreased from 4.1 to 4.0 lbs./person/day over the 10-year (2010-2020) period. In addition, the total annual disposal tonnage in Clovis increased by 14,865 tons over the 2010-to-2020-time span. With the passage of SB 1016, per capita disposal rate is used to determine the diversion progress of a city and not the jurisdictional diversion rates. Therefore, a population increase resulting in the generation of more overall city waste does not affect the jurisdiction's ability to meet its waste goals.

TABLE 3.14-9: SOLID WASTE GENERATION RATES

YEAR	WASTE GENERATION RATE (LBS./PERSON/DAY)	POPULATION	TOTAL DISPOSAL TONNAGE (TONS/YEAR)
2010	4.10	95,480.00	71,202.74
2011	3.40	97,218.00	60,354.45
2012	3.30	98,611.00	60,132.17
2013	3.00	99,983.00	53,954.32
2014	3.20	102,188.00	59,098.66
2015	3.50	104,339.00	66,168.03
2016	3.70	108,109.00	73,642.65
2017	3.70	110,532.00	74,994.56
2018	3.90	113,895.00	80,919.57
2019	3.70	117,003.00	77,958.05
2020	4.00	118,741.00	86,067.32
2021	4.40	121,667.00	97,186.92

SOURCE: CAL RECYCLE, 2021

Table 3.14-10 presents the City's waste disposal rate targets relative to the actual rates achieved on a per capita basis. It is noted that the City is surpassing waste generation rate targets for over a decade. In accordance with AB 939, which required municipalities to aggressively pursue Municipal Solid Waste (MSW) source reduction and recycling, the City continues to meet and exceed all AB 939 goals. The various solid waste management actions adopted by the City include, but are not limited to, recycling and yard waste programs for residents and businesses, public education and public outreach awareness events, and school recycling and composting.

TABLE 3.14-10: CITY OF CLOVIS WASTE DISPOSAL RATE TARGETS (POUNDS PER PERSON/DAY)

YEAR	*POPULATION*		*EMPLOYMENT*	
	TARGET	*ACTUAL*	*TARGET*	*ACTUAL*
2010	4.7	4.10	15.5	15.80
2011	4.7	3.40	15.5	12.30
2012	4.7	3.30	15.5	12.30
2013	4.7	3.00	15.5	10.90
2014	4.7	3.20	15.5	10.40
2015	4.7	3.50	15.5	11.40
2016	4.7	3.70	15.5	12.10
2017	4.7	3.70	15.5	11.90
2018	4.7	3.90	15.5	12.90
2019	4.7	3.70	15.5	12.00
2020	4.7	4.00	15.5	13.20
2021	4.7	4.40	15.5	15.10

Landfill Capacity

As stated, solid waste from Clovis is primarily landfilled at the City of Clovis Landfill. Clovis Landfill is currently permitted to accept no more than 2,000 tons per day. The allotted disposal area is 76.3 acres, and it is designed to hold 7.8 million cubic yards of inert or designated wastes. The remaining capacity is 7.74 million cubic yards. At that time the capacity is reached, the City can utilize other landfills and recycling facilities within the greater Fresno-Clovis area. Other landfills used in the region include Fairmead, Avenal, Rice Road Recycle and Jefferson Avenue Station, among others. All landfills in the region are summarized in Table 3.14-11 below. Table 3.14-12 summarizes the City of Clovis' disposal rate targets, as identified by Cal Recycle.

TABLE 3.14-11: CITY OF CLOVIS LANDFILL SUMMARY

LANDFILL	*LOCATION*	*MAXIMUM DAILY THROUGHPUT (TONS/DAY)*	*REMAINING CAPACITY (CUBIC YARDS)*	*ANTICIPATED CLOSURE DATE*
Clovis Landfill	Clovis	2,000	7.74 million	2066
American Avenue Disposal Site	Kerman	2,200	29.39 million	2031
Fairmead	Madera	1,100	5.55 million	2028
Avenal Regional Landfill	Avenal	6,000	28.9 million	2056
Rice Road Recycling & Transfer Station	Fresno	400	--	--
Jefferson Avenue Transfer Station	Fresno	1,250	--	--

REGULATORY SETTING

Resource Conservation and Recovery Act

The Resource Conservation and Recovery Act (RCRA) was enacted in 1976 to address the huge volumes of municipal and industrial solid waste generated nationwide. After several amendments, the current Act governs the management of solid and hazardous waste and underground storage tanks (USTs). RCRA was an amendment to the Solid Waste Disposal Act of 1965. RCRA has been amended several times, most significantly by the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRA is a combination of the first solid waste statutes and all subsequent amendments. RCRA authorizes the Environmental Protection Agency (EPA) to regulate waste management activities. RCRA authorizes states to develop and enforce their own waste management programs, in lieu of the Federal program, if a state's waste management program is substantially equivalent to, consistent with, and no less stringent than the Federal program.

California Integrated Waste Management Act (AB 939 and SB 1322)

The California Integrated Waste Management Act of 1989 (AB 939 and SB 1322) requires every city and county in the state to prepare a Source Reduction and Recycling Element to its Solid Waste Management Plan that identifies how each jurisdiction will meet the mandatory state waste diversion goals of 25 percent by 1995 and 50 percent by 2000. The purpose of AB 939 and SB 1322 is to “reduce, recycle, and re-use solid waste generated in the state to the maximum extent feasible.” The term “integrated waste management” refers to the use of a variety of waste management practices to safely and effectively handle the municipal solid waste stream with the least adverse impact on human health and the environment. The Act has established a waste management hierarchy, as follows: Source Reduction; Recycling; Composting; Transformation; and Disposal.

California Integrated Waste Management Board Model Ordinance

Subsequent to the Integrated Waste Management Act, additional legislation was passed to assist local jurisdictions in accomplishing the goals of AB 939. The California Solid Waste Re-use and Recycling Access Act of 1991 (§42900-42911 of the Public Resources Code) directs the California Integrated Waste Management Board (CIWMB) to draft a “model ordinance” relating to adequate areas for collecting and loading recyclable materials in development projects. The model ordinance requires that any new development project, for which an application is submitted on or after September 1, 1994, include “adequate, accessible, and convenient areas for collecting and loading recyclable materials.” For subdivisions of single-family detached homes, recycling areas are required to serve only the needs of the homes within that subdivision.

California Green Building Standards Code (CALGreen)

CALGreen requires the diversion of at least 50 percent of the construction waste generated during most new construction projects (CALGreen Sections 4.408 and 5.408) and some additions and alterations to nonresidential building projects.

California Mandatory Commercial Recycling Law (AB 341)

Assembly Bill (AB) 341 directed CalRecycle to develop and adopt regulations for mandatory commercial recycling. The final regulation was approved by the Office of Administrative Law on May 7, 2012. The purpose of AB 341 is to reduce GHG emissions by diverting commercial solid waste to recycling efforts and to expand the opportunity for additional recycling services and recycling manufacturing facilities in California.

Beginning on July 1, 2012, businesses have been required to recycle, and each jurisdiction has implemented programs that include education, outreach, and monitoring. Jurisdictions were required to start reporting on their 2012 Electronic Annual Report (due August 1, 2013) on their initial education, outreach, and monitoring efforts, and, if applicable, on any enforcement activities or exemptions implemented by the jurisdiction.

In addition to Mandatory Commercial Recycling, AB 341 sets a statewide goal for 75 percent disposal reduction by the year 2020. This is not written as a 75 percent diversion mandate for each jurisdiction. The 50 percent disposal reduction mandate still stands for cities, counties, and State agencies (including community colleges) under AB 939. CalRecycle continues to evaluate program implementation as it has in the past through the Annual Report review process for entities subject to either AB 939.

Assembly Bill 1826 Mandatory Commercial Organics Recycling

In October 2014 Governor Brown signed AB 1826, requiring businesses to recycle their organic waste on and after April 1, 2016, depending on the amount of waste they generate per week. This law also requires that on and after January 1, 2016, local jurisdictions across the state implement an organic waste recycling program to divert organic waste generated by businesses, including multifamily residential dwellings that consist of five or more units (please note, however, that multi-family dwellings are not required to have a food waste diversion program). Organic waste (also referred to as organics) means food waste, green waste, landscape and pruning waste, nonhazardous wood waste, and food-soiled paper waste that is mixed in with food waste. This law phases in the mandatory recycling of commercial organics over time, while also offering an exemption process for rural counties. In particular, the minimum threshold of organic waste generation by businesses decreases over time, which means an increasingly greater proportion of the commercial sector will be required to comply.

Starting on January 1, 2019, businesses that generate 4 cubic yards or more of commercial solid waste per week shall arrange for organic waste recycling services. If CalRecycle determines that the statewide disposal of organic waste in 2020 has not been reduced by 50 percent of the level of disposal during 2014, the organic recycling requirements on businesses will expand to cover businesses that generate 2 cubic yards or more of commercial solid waste per week. Additionally, certain exemptions may no longer be available if this target is not met.

SB 1374 (Construction and Demolition Waste Materials Diversion)

Senate Bill 1374 (SB 1374), Construction and Demolition Waste Materials Diversion Requirements, requires that jurisdictions summarize their progress realized in diverting construction and demolition waste from the waste stream in their annual AB 939 reports. SB 1374 required the CIWMB to adopt a model construction and demolition ordinance for voluntary implementation by local jurisdictions.

AB 2176 (Montanez, Chapter 879, Statues of 2004)

This law requires the largest venue facilities and events (as defined) in each city and county to plan and implement solid waste diversion programs, and annually report the progress of those upon the request of their local government. In turn, local jurisdictions must report to the CIWMB waste diversion information for the top 10 percent of venues and events by waste generation.

A large event is defined as:

1. Serves an average of more than 2,000 individuals per day of operation (both people attending the event and those working at it—including volunteers—are included in this number); and
2. Charges an admission price or is run by a local agency.

The bill specifically includes public, nonprofit, or privately owned parks, parking lots, golf courses, street systems, or other open space when being used for an event, including, but not limited to, a sporting event or a flea market in addition to events that meet both of the above.

A large venue is defined as:

- A permanent facility that annually seats or serves an average of more than 2,000 individuals within the grounds of the facility per day of operation (both people attending the event and those working at it—including volunteers too—are included in this number).

Venues include, but are not limited to airports, amphitheaters, amusement parks, aquariums, arenas, conference or civic centers, fairgrounds, museums, halls, horse tracks, performing arts centers, racetracks, stadiums, theaters, zoos, and other public attraction facilities.

Senate Bill 1383 Short-Lived Climate Pollutants: Organic Waste Methane Emissions Reductions

In September 2016, Governor Brown signed SB 1383, establishing methane emissions reduction targets in a statewide effort to reduce emissions of short-lived climate pollutants (SLCP) in various sectors of California's economy. The bill codifies the California Air Resources Board's Short-Lived Climate Pollutant Reduction Strategy, established pursuant to SB 605, in order to achieve reductions in the statewide emissions of short-lived climate pollutants. Actions to reduce short-lived climate pollutants are essential to address the many impacts of climate change on human health, especially in California's most at-risk communities, and on the environment.

As it pertains to solid waste, SB 1383 establishes targets to achieve a 50 percent reduction in the level of the statewide disposal of organic waste from the 2014 level by 2020 and a 75 percent reduction by 2025. The law grants CalRecycle the regulatory authority required to achieve the organic waste disposal reduction targets and establishes an additional target that not less than 20 percent of currently disposed edible food is recovered for human consumption by 2025.

City of Clovis General Plan

Policies: Community Facilities Element

- Policy 2.1 Minimize landfill disposal of solid waste. Promote solid waste source reduction, reuse, and recycling; composting; and the environmentally-safe transformation of wastes.
- Policy 2.2 Waste diversion rate. Meet the state's current and future waste diversion goals through the city's recycling and diversion programs.
- Policy 2.3 Expanded recycling. Increase recycling by commercial, industrial, and multifamily generators.
- Policy 2.4 Green and household hazardous materials waste. Encourage citywide participation in green waste reduction and household hazardous waste disposal programs.
- Policy 2.5 Clovis landfill. Maintain at least 15 years of ongoing landfill capacity.
- Policy 2.6 Solid waste facility encroachment. Protect existing or planned solid waste facilities from encroachment by incompatible land uses that may be allowed through discretionary land use permits or changes in land use or zoning designations.

Clovis Municipal Code

Municipal Code Chapter 3.10 Development Impact Fees, the purpose of this chapter is to establish a uniform set of procedures applicable to AB 1600 development impact fees that are adopted pursuant to the authority set forth in Government Code Section 66000 et seq. and the Municipal Code. These procedures are intended to apply to all AB 1600 development impact fees adopted by the City regardless of whether there is an existing similar provision in the applicable chapter or section of the Municipal Code establishing the fee. If there is a conflict between this chapter and an existing similar provision in the applicable chapter or section of the Municipal Code establishing the fee, the provisions of this chapter shall control.

The Municipal Code regulates garbage and trash operations through Chapter 6.3, Garbage and Rubbish. This Chapter allows the City monitor and regulate all garbage, rubbish, greenwaste, and recyclables, the containers the materials are collected in, and the collection process itself. This Chapter establishes collection and collection points (Chapter 6.3.06) and collection rates (Chapter 6.3.08). Chapter 6.3.1, Recycling and Diversion of Construction and Demolition Debris, and Chapter 6.3.2, Mandatory Organic Waste and Disposal Reduction Regulations, are also contained in this Title, and further authorize the City to maintain public services.

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the proposed Project will have a significant impact on the environment associated with Utilities if it will:

- Generate solid waste in excess of State or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; and/or
- Comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

IMPACTS AND MITIGATION MEASURES

Impact 3.14-6: The proposed Project has the potential to be served by a landfill with sufficient permitted capacity to accommodate the Project's solid waste disposal needs and comply with federal, State, and local statutes and regulations related to solid waste. (Less than Significant)

As previously described, permitted maximum disposal at the Clovis Landfill (SWIS Number 10-AA-0004) is 2,000 tons per day. The total permitted capacity of the landfill is 7.8 million cubic yards, of which, 7.74 million cubic yards remain. This landfill has an expected cease operation date in the year 2066. Additionally, the American Avenue Landfill has a maximum permitted capacity of 32,700,000 cubic yards and a remaining capacity of 29,358,535 cubic yards, with an estimated closure date of August 31, 2031. As noted previously, the vast majority of waste disposed from the City of Clovis went to Clovis Landfill.

The City already utilizes the American Avenue Disposal Site, Avenal Regional Landfill, and Fairmead Solid Waste Disposal Site; in 2019 Clovis disposed of 11,586 tons to the American site, 358 tons to the Avenal site and 1,956 tons to the Fairmead site. (Cal Recycle, 2022C, D, E).

The Avenal Regional Landfill has the furthest operation date; the landfill is expected to operate until March of 2056. Avenal has a remaining capacity of 28,900,000 cubic yards, and has a current maximum permitted throughput of 6,000 tons per day.

New residential land uses in the Development Area of the Project site would increase the amount of solid waste generated by residents. The increase in growth and development as a result of the implementation of the proposed Project could result in an increase of solid waste to transfer stations and landfills, and could contribute to an increased demand for solid waste services throughout the City. Solid waste generated by the proposed Project was estimated based on CalRecycle generation rate estimates by use. Per CalRecycle generation rate estimates, the Development Area is estimated to generate roughly 12 pounds per household per day[1]. It is estimated that the proposed 605 residential units would generate approximately 7,400 pounds per day of solid waste. The total solid

---

[1] Note: data based on CalRecycle estimated solid waste generation rates for single family residential uses.; 12.23 lbs./household/day. (CalRecycle, 2022A).

waste generated by the proposed Project is estimated to be 3.7 tons per day. This equates to roughly 0.185 percent of the total allowable daily maximum disposal at the Clovis Landfill and would not cause an exceedance of the landfill's remaining capacity. Therefore, the City's projected increase in solid waste generation associated with future buildout of the proposed Project is expected to be within the permitted capacities of landfills utilized by the City. Based on the estimated closure dates of the Clovis Landfill in 2066 and the American Avenue Landfill in 2031, development under the proposed Project would not result in a significant impact on landfill capacity. This is a **less than significant** impact.

3.14.5 ENERGY & TELECOMMUNICATIONS

ENVIRONMENTAL SETTING

Pacific Gas and Electric (PG&E) provides electrical service to the City of Clovis, its sphere of influence, and Fresno County. Electrical service is supplied by underground and overhead lines routed through three substations in the greater Clovis area. Telecommunications and phone services are provided by AT&T, and cable services are provided by Comcast. The hierarchy of establishing electrical power lines from generation stations to customers is as follows: transmission distribution; sub-transmission; and service. PG&E provides gas to customers through plastic and steel underground lines. The project site will not provide natural gas to the site. Residents not serviced by PG&E use propane fuel (City of Clovis, 2014).

REGULATORY SETTING

California Electrical Code

The California Electrical Code is codified in Title 24, CCR, Part 3. The Electrical Code contains regulations including, but not limited to, electrical materials, electrical wiring, overcurrent protection, grounding, and installation.

City of Clovis Municipal Code

Title 7, Public Works, of the Clovis Municipal Code contains Chapter 7.3, Underground Utility Districts, and Chapter 7.5, Underground Wiring. Chapter 7.3 regulates underground utility districts for the purposes of public necessity, health, safety, and welfare. Chapter 7.5 states that all utility facilities (including, but not limited to, electrical, communication and cable television lines) located within the boundaries of a development project property or to be installed in and for the purpose of supplying service to any development project shall be placed underground; and that the developer shall be responsible for compliance with the provisions of this section. It shall be the responsibility of the developer to make the necessary arrangements with the serving utility owner for the installation of an underground system, owned and operated by the utility owner. The developer shall submit satisfactory evidence thereof prior to the acceptance and approval of the development project.

The City officially adopts the California Electrical Code, and subsequent amendments, in Chapter 8.2, Electrical Code.

Chapter 9.42 Wireless telecommunications facilities, provides regulations regarding the location and design of wireless communications facilities, and intends to ensure that the installation of wireless communication facilities will not be detrimental to the City’s public health, safety, or welfare. It is the intention of this chapter to treat wireless communications facilities, including antennas, in the same way that other mechanical equipment (e.g., air conditioners) are treated, and to require proper screening and architectural compatibility.

City of Clovis General Plan

Policies: Public Services & Utilities Element

- Policy 1.1 New Development. New development shall pay its fair share of public facility and infrastructure improvements.

Policies: Open Space & Conservation Element

- Policy 3.5 Energy and water conservation. Encourage new development and substantial rehabilitation projects to exceed energy and water conservation and reduction standards set in the California Building Code.
- Policy 3.6 Renewable Energy. Promote the use of renewable and sustainable energy sources to serve public and private sector development.
- Policy 3.7 Construction and design. Encourage new construction to incorporate energy efficient building and site design strategies.

THRESHOLDS OF SIGNIFICANCE

Consistent with Appendix G of the CEQA Guidelines, the proposed Project may have a significant impact on the environment associated with Utilities if it would:

- Require or result in the relocation or construction of new or expanded electrical, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects.

IMPACTS AND MITIGATION MEASURES

Impact 3.14-7: The proposed Project has the potential to require or result in the construction of new electrical, or telecommunications facilities, the construction of which could cause significant environmental effects. (Less than Significant)

Electrical services are provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along Shepherd Avenue and from existing residential development surrounding the Project site. PG&E and AT&T operate and maintain transmission and distribution infrastructure in the Project area. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Although the proposed Project would increase demand for electricity, and telecommunications facilities, utility improvements would be installed in conjunction with planned street improvements. Although the Project would require construction of new electrical facilities within the site, these improvements would be limited to connections to existing facilities near the Project site. The potential environmental effects associated with construction and operation of the proposed Project, including the installation of the proposed electrical improvements in the roadway rights-of-way to serve the proposed development, are analyzed throughout this EIR under each environmental topical area. The proposed Project would not result in the relocation or construction of new or expanded electrical, and telecommunications facilities, the construction or relocation of which could cause significant environmental effects. This is a **less than significant** impact.

OTHER CEQA-REQUIRED TOPICS 4.0

The California Environmental Quality Act (CEQA) requires that an Environmental Impact Report (EIR) to evaluate a project's effects in relationship to broader changes occurring, or that are foreseeable to occur, in the surrounding environment. Accordingly, this chapter presents a discussion of CEQA-mandated analysis for cumulative impacts, significant irreversible effects, and significant and unavoidable impacts associated with the proposed Project.

4.1 CUMULATIVE SETTING AND IMPACT ANALYSIS

INTRODUCTION

CEQA requires that an EIR contain an assessment of the cumulative impacts that could be associated with the proposed Project. According to CEQA Guidelines Section 15130(a), "an EIR shall discuss cumulative impacts of a project when the project's incremental effect is cumulatively considerable." "Cumulatively considerable" means that the incremental effects of an individual project are considerable when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects (as defined by Section 15130). As defined in CEQA Guidelines Section 15355, a cumulative impact consists of an impact that is created as a result of the combination of the project evaluated in the EIR together with other projects causing related impacts. A cumulative impact occurs from:

> *…the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time.*

In addition, Section 15130(b) identifies that the following three elements are necessary for an adequate cumulative analysis:

1) Either:

    (A) A list of past, present, and probable future projects producing related or cumulative impacts, including, if necessary, those projects outside the control of the agency; or,

    (B) A summary of projections contained in an adopted general plan or related planning document, or in a prior environmental document which has been adopted or certified, which described or evaluated regional or area wide conditions contributing to the cumulative impact. Any such planning document shall be referenced and made available to the public at a location specified by the lead agency.

2) A summary of the expected environmental effects to be produced by those projects with specific reference to additional information stating where that information is available; and

3) A reasonable analysis of the cumulative impacts of the relevant projects. An EIR shall examine reasonable, feasible options for mitigating or avoiding the project's contribution to any significant cumulative effects.

Where a lead agency is examining a project with an incremental effect that is not "cumulatively considerable," a lead agency need not consider that effect significant, but shall briefly describe its basis for concluding that the incremental effect is not cumulatively considerable.

CUMULATIVE SETTING

The cumulative setting uses growth projections listed in the City of Clovis Municipal Services Review (2019), and State of California Department of Finance population forecast statistics. Table 4.0-1 shows growth projections.

TABLE 4.0-1: GROWTH PROJECTIONS

CALENDAR YEAR	*ESTIMATED POPULATION (CLOVIS)*	*ESTIMATED POPULATION (FRESNO COUNTY)*	*ESTIMATED POPULATION (CALIFORNIA)*
2025	136,350	1,053,955	40,808,001
2030	145,050	1,096,638	41,860,549
2035	153,490	1,1235,837	42,718,403
2040	161,580	1,170,525	43,353,414

SOURCES: FRESNO LAFCO – CITY OF CLOVIS MUNICIPAL SERVICE REVIEW AND SPHERE OF INFLUENCE UPDATE (2019), STATE OF CALIFORNIA DEPARTMENT OF FINANCE – POPULATION FORECAST PROJECTIONS (2020).

CUMULATIVE EFFECTS OF THE PROJECT

Cumulative settings are identified under each cumulative impact analysis. Cumulative settings vary because the area that the impact may affect is different. For example, noise impacts generally only impact the local surrounding area because noise travels a relatively short distance, while air quality impacts affect the whole air basin as wind currents control air flow and are not generally affected by natural or manmade barriers which would affect noise. Cumulative Project impacts are addressed and summarized below.

Method of Analysis

Although the environmental effects of an individual project may not be significant when that project is considered separately, the combined effects of several projects may be significant when considered collectively. State CEQA Guidelines 15130 requires a reasonable analysis of a project's cumulative impacts, which are defined as "two or more individual effects which, when considered together are considerable or which compound or increase other environmental impacts." The cumulative impact that results from several closely related projects is: the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonably foreseeable probable future projects. Cumulative impacts can result from individually minor, but collectively significant projects taking place over a period of time (State CEQA Guidelines 15355[b]). Cumulative impact analysis may be less detailed than the analysis of the project's individual effects (State CEQA Guidelines 15130[b]).

There are two approaches to identifying cumulative projects and the associated impacts. The list approach identifies individual projects known to be occurring or proposed in the surrounding area in order to identify potential cumulative impacts. The projection approach uses a summary of projections in adopted General Plans or related planning documents to identify potential cumulative impacts. This EIR uses the projection approach for the cumulative analysis and considers the development anticipated to occur upon buildout of the various General Plans in the area.

Project Assumptions

The proposed Project's contribution to environmental impacts under cumulative conditions is based on full buildout of the Project site. See Chapter 2.0, Project Description, for a complete description of the proposed Project.

Cumulative Impacts

Some cumulative impacts for issue areas are not quantifiable and are therefore discussed in general terms as they pertain to development patterns in the surrounding region. Exceptions to this are traffic, utilities, noise and air quality (the latter two of which are associated with traffic volumes), which may be quantified by estimating future traffic patterns, pollutant emitters, etc. and determining the combined effects that may result. In consideration of the cumulative scenario described above, the proposed Project may result in the following cumulative impacts.

AESTHETICS AND VISUAL RESOURCES

The cumulative setting for aesthetics is the City of Clovis and surrounding areas of Fresno County.

Impact 4.1: Cumulative Degradation of the Existing Visual Character of the Region (Less than Significant and less than Cumulatively Considerable)

As described in Section 3.1, Aesthetics and Visual Resources, development of the proposed Project would involve the annexation of 77 acres (Development Area) into the City of Clovis to develop up to 605 single family detached units, open space totaling approximately 5.54 acres including, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, and associated roadway improvements.

In order to reduce the visual impacts of the development, development within the Project site is required to be consistent with the General Plan and the Clovis Zoning Ordinance, which includes design standards. The design standards will ensure quality and cohesive design of the Project site. These standards include specifications for building height, massing, and orientation, exterior lighting standards, and landscaping standards. Following the City's design requirements will produce a project that will be internally cohesive, while maintaining an aesthetic feel similar to that of the surrounding uses.

The loss of the visual appearance of the agricultural land on the site will change the visual character of the Project site in perpetuity, which some people are expected to view as a loss of a visually attractive amenity. Compliance with the requirements within the General Plan and Zoning Code would reduce visual impacts to the greatest extent feasible; and the change of agricultural land to a landscaped subdivision is not necessarily a degrading of visual character. The General Plan EIR finds that new development would have a less than significant impact on aesthetics.

Under cumulative conditions, buildout of the General Plan for Clovis and the surrounding jurisdictions could result in changes to the visual character and quality of the City of Clovis through development of undeveloped areas and/or changes to the character of existing communities. Development of the proposed Project, in addition to other future projects in the area, would change the existing visual and scenic qualities of the City. However, the City of Clovis has adopted specific landscape and design standards to enhance the visual appearance of the Project site and adjacent areas. As such, this is a **less than significant** cumulative impact. As such, impacts relative to degradation of visual character would be a **less than cumulatively considerable contribution** and no mitigation is required.

Impact 4.2: Cumulative Damage to Scenic Resources within a State Scenic Highway (Less than Significant and Less than Cumulatively Considerable)

There are no designated State Scenic Highways in the vicinity of the Project site. No officially designated State scenic highways are located in the City of Clovis. The nearest eligible State scenic highway to the City is State Route 168, which is located in Fresno County northeast of the City of Clovis. The City of Clovis and the Project site are not visible from this roadway segment. Additionally, there are no “eligible” highway segments in the Project vicinity that may be included in the State Scenic Highway system. As such, this is a **less than significant** cumulative impact. As such, impacts relative to scenic resources would be a **less than cumulatively considerable contribution** and no mitigation is required.

Impact 4.3: Cumulative Impact on Light and Glare (Less than Significant and Less than Cumulatively Considerable)

The proposed Project would be required to implement existing City regulations aimed at reducing light and glare impacts to ensure that no unusual daytime glare or nighttime lighting is produced. Specifically, the Clovis Development Code states that direct glare shall not be permitted and provides standards for nuisance prevention and shielding requirements. Section 9.22.050 of the Clovis Development Code contains standards and provisions related to exterior lighting. While implementation of regulations and standards within the Clovis Development Code would reduce impacts associated with increased light and glare, the impacts would not be eliminated entirely, and the overall level of light and glare in the Project site would increase in general as urban development occurs.

Overall, the proposed Project would introduce new sources of daytime and nighttime lighting within the Project site that do not currently exist. However, it is noted there are no specific features within the proposed Project that would create unusual light and glare. Light sources from the proposed Project can have an adverse impact on the surrounding areas, by introducing nuisance light into the area and decreasing the visibility of nighttime skies. Additionally, light sources can create light spillover impacts on surrounding land uses in the absence of a lighting plan that includes photometrics of the lighting. Any new lighting associated with development of the proposed Project would be pedestrian-scale lighting and the fixtures would be consistent with the style and technical specifications approved by the City, including compliance with the City's light and glare regulations under Section 9.22.050 of the Clovis Development Code, which requires that light be shielded so that light does not spill onto adjacent properties. The City's existing requirements require a lighting plan to be submitted to the City for review and approval for the improvement plans, as well as for the building plans. All proposed outdoor lighting is required to meet applicable City standards regulating outdoor lighting, including 9.22.050 Exterior light and glare of the City's Development code, in order to minimize any impacts resulting from outdoor lighting on adjacent properties. Implementation of the existing City standards would reduce potential impacts associated with nighttime lighting and light spillage onto adjacent properties to a less than significant level.

Future projects within Clovis and Fresno County would be subject to the light and glare standards established by the individual jurisdictions. These regulations are designed to minimize potential light and glare impacts of new development. Implementation of these regulations would ensure that future projects minimize their potential cumulative light and glare impacts resulting in a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to nighttime lighting and daytime glare would be a **less than cumulatively considerable contribution**.

AGRICULTURAL RESOURCES

The cumulative setting for agriculture and forest resources is all of Fresno County. According to the Department of Conservation, the total acreage of crop land in the county is approximately 1,355,142 acres. The gross value of agricultural production in Fresno County for 2021 was $8,085,567,000 which represents an increase of $117,167,000 or 1.47% above the previous year's revised total of $7,968,400,000.

Impact 4.4: Cumulative Impact on Agricultural Resources *(Less than Significant and Less than Cumulatively Considerable)*

The Project site is not under a Williamson Act Contract. However, as described in Section 3.2, development of the proposed Project would result in the permanent conversion of approximately 63.60 acres of Prime Farmland and 11.44 acres of Farmland of Statewide Importance, as designated by the California Department of Conservation on the June 2020 Important Farmlands Map and as shown on Figure 3.2-1, to nonagricultural use. After looking at site-specific characteristics more closely for the Project site, it is noteworthy that the Department of Conservation's designations do not accurately and fully consider site specific characteristics such as the existence of a hardpan within the upper horizon of the soil profile, the project size, surrounding urban uses, lack of agricultural protection zones in the zone of influence, lack of water resources, and ongoing economic feasibility of agricultural operations due to other factors. To reconcile this inaccuracy and analyze the site-specific characteristics more fully, the Clovis General Plan calls for the use of the Land Evaluation and Site Assessment (LESA) to evaluate the significance of the agricultural conversion. It is noted that the LESA model was developed by the Department of Conservation, which is the same agency that published the 2020 Important Farmland's Map.

The California Land Evaluation and Site Assessment (LESA) Model was utilized to determine the proposed Project's potential impact on agricultural resources. The LESA scoring for the proposed Project is documented on the LESA scoring sheets in Appendix B. The proposed Project has a final LESA score of 50.50, which is considered to be a significant impact only if the Land Evaluation and Site Assessment sub scores are each greater than or equal to 20 points. The proposed Project has a sub score of 32.50 for the Land Evaluation and a sub score of 18.0 for the Site Assessment, which means the conversion of the land on the Project site is not considered significant according to the California Department of Conservation's established thresholds.

After evaluating the site-specific soil characteristics, project size, surrounding uses, agricultural protection zones, water resources availability, and ongoing economic feasibility of agricultural operations utilizing the LESA Model, it was determined that the conversion of the land on the Project site is not a significant impact. Therefore, implementation of the proposed Project would have a **less than significant** impact relative to this topic and no mitigation is required. As such, impacts to agricultural resources would be a **less than cumulatively considerable contribution**.

AIR QUALITY

The cumulative setting for air quality impacts is the San Joaquin Valley Air Basin (SJVAB), which consists of eight counties, stretching from Kern County in the south to San Joaquin County in the north. The SJVAB is bounded by the Sierra Nevada in the east, the Coast Ranges in the west, and the Tehachapi mountains in the south.

Impact 4.5: Cumulative Impact on the Region's Air Quality (Less than Significant and Less than Cumulatively Considerable)

Under buildout conditions in Fresno County, the SJVAB would continue to experience increases in criteria pollutants and efforts to improve air quality throughout the basin would be hindered. As described in Section 3.3, Fresno County has a State designation Attainment or Unclassified for all criteria pollutants except for ozone, PM_{10} and $PM_{2.5}$. Fresno County has a national designation of either Unclassified or Attainment for all criteria pollutants except for Ozone and $PM_{2.5}$. Table 3.3-2 in Section 3.3 presents the state and national attainment status for Fresno County.

As discussed under Impact 3.3-1 in Section 3.3, the SJVAPCD has established their thresholds of significance by which the Project emissions are compared against to determine the level of significance. The SJVAPCD has established operations related emissions thresholds of significance as follows: 100 tons per year of carbon monoxide (CO), 10 tons per year of oxides of nitrogen (NO_x), 10 tons per year of reactive organic gases (ROG), 27 tons per year of sulfur oxides (SO_x), 15 tons per year PM_{10}, and 15 tons per year $PM_{2.5}$.

As shown in Table 3.3-6, operational emissions would not exceed the SJVACPD thresholds of significance for criteria pollutants. Additionally, as shown in Table 3.3-7, construction emissions would not exceed the SJVACPD thresholds of significance for criteria pollutants. As such, development of the proposed Project would have a **less than significant** and **less than cumulatively considerable contribution**.

BIOLOGICAL RESOURCES

The cumulative setting for biological resources includes the Project site and the greater Fresno County region. Development associated with implementation of the local General Plan(s) would contribute to the ongoing loss of natural and agricultural lands in Fresno County, including the Project site. Cumulative development would result in the conversion of existing habitat to urban uses. The local General Plan(s), in addition to regional, State and federal regulations, includes policies and measures that mitigate impacts to biological resources associated with General Plan buildout.

Impact 4.6: Cumulative Loss of Biological Resources Including Habitats and Special Status Species (Less than Significant and Less than Cumulatively Considerable)

Under cumulative conditions, buildout of the General Plan(s) within Fresno County will result in impacts to biological resources in the cumulative area through new and existing development. The General Plan(s) includes policies that are designed to minimize impacts to the extent feasible.

As described in Section 3.4, Biological Resources, construction in the Project site has the potential to result in impacts to special-status species in the region. Although there has been no documented sighting within the immediate area in, or near the Project site, the Project site provides potential habitat for several species, including those discussed in Section 3.4.

Mitigation Measure 3.4-1 requires measures to avoid or minimize impacts on other protected bird species that may occur on the site. In addition, Mitigation Measure 3.4-2 requires that, prior to grading, the Project applicant is required to conduct a survey of the area to be graded for bat roosts, and if present, the Project applicant shall implement the following measures to avoid or minimize impacts on special-status bats.

Implementation of Mitigation Measure 3.4-1 and Mitigation Measure 3.4-2 in Section 3.4 would reduce potentially cumulative impacts to a **less than significant** level. As such, impacts to biological resources would be a **less than cumulatively considerable contribution**.

CULTURAL AND TRIBAL RESOURCES

The geography of cultural resources impact can be defined by region, by political subdivision or by the geography of the cultural resources present in an area, where sufficient inventory data is available to define it. The cumulative setting for cultural resources includes all of the Fresno County. There are extensive cultural sites located in the region.

Impact 4.7: Cumulative Impacts on Known and Undiscovered Cultural and Tribal Resources (Less than Significant and Less than Cumulatively Considerable)

Cumulative development anticipated in the City of Clovis, including growth projected by adopted future projects, may result in the discovery and removal of cultural resources, including archaeological, paleontological, historical, and Native American resources and human remains. As discussed in Section 3.5, Cultural and Tribal Resources, no historic period resources were previously recorded in the Development Area.

Any previously unknown cultural resources which may be discovered during development of the proposed Project would be required to be preserved, either through preservation in place, excavation, documentation, curation, data recovery, or other appropriate measures. With implementation of the mitigation measures provided in Section 3.5, the proposed Project is not anticipated to considerably contribute to a significant reduction in cultural resources in the region.

All future projects in the regional vicinity would be subject to their respective General Plans (e.g. City of Clovis, and Fresno County), each of which have policies and measures that are designed to ensure protection of undiscovered cultural resources. In addition, all discretionary projects in these jurisdictions would require environmental review per regulations established in CEQA.

development of the proposed Project would have a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to cultural resources would result in a **less than cumulatively considerable contribution**.

GEOLOGY AND SOILS

Impacts related to geology and soils are not inherently cumulative. Geology and soils concerns are related to risks, hazards or development constraints that are largely site-specific. However, seismic hazards are regional, and management of seismic hazards is vested with the local planning and building authority. For these reasons, the potential for cumulative geology and soils impacts are considered in the context of the City of Clovis and vicinity.

Impact 4.8: Cumulative Impact on Geologic and Soils Resources (Less than Significant and Less than Cumulatively Considerable)

As discussed in Section 3.6 Geology and Soils, development of the proposed Project has limited potential for liquefaction, liquefaction induced settlement, and lateral spreading. However, mitigation measures provided in Section 3.6 ensure this impact will be less than significant. While the City is not within an area known for its seismic activity, there will always be a potential for groundshaking caused by seismic activity anywhere in California, including the Project site. Seismic activity could come from a known active fault s in the region. In order to minimize potential damage to the buildings and site improvements, all construction in California is required to be designed in accordance with the latest seismic design standards of the California Building Code. Additionally, the City of Clovis has incorporated numerous policies relative to seismicity to ensure the health and safety of all people. Design in accordance with these standards and policies would reduce any potential impact to a less than significant level.

Geologic and soils impacts tend to be site-specific and Project-specific. With the mitigation measures presented in Section 3.6, development of the proposed Project would not result in increased risks or hazards related to geologic conditions in the cumulative setting area, nor would it result in any off-site or indirect impacts. Development of the proposed Project would have a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to geologic and soil resources would result in a l**ess than cumulatively considerable contribution**.

GREENHOUSE GASES, CLIMATE CHANGE AND ENERGY

The cumulative setting for greenhouse gas emissions and climate change impacts for this analysis is Fresno County, which is the boundary for the California Air Resources Board's regional greenhouse gas emissions reduction targets.

Impact 4.9: Cumulative Impact on Climate Change from Increased Project-Related Greenhouse Gas Emissions (Less than Significant and Less than Cumulatively Considerable)

Greenhouse gas emissions from a single Project will not cause global climate change; however, greenhouse gas emission from multiple projects throughout a region or state could result in a cumulative impact with respect to global climate change.

In California, there has been extensive legislation passed with the goal of reducing greenhouse gas emissions. The legislative goals are as follows: by 2010, reduce GHG emissions to 2000 levels; by 2020, reduce GHG emissions to 1990 levels; by 2050, reduce GHG emissions to 80 percent below 1990 levels. To meet the targets, the Governor directed several State agencies to cooperate in the development of a climate action plan. The Secretary of Cal-EPA leads the Climate Action Team, whose goal is to implement global warming emission reduction programs identified in the Climate Action Plan and to report on the progress made toward meeting the emission reduction targets established in the executive order.

As presented in the table, short-term construction emissions of GHGs are estimated at a maximum of approximately 776.8 MT CO_2e per year. As shown in the following table, the annual mitigated GHG emissions associated with the proposed Project would be approximately 5,071 MT CO_2e. Consistent with the population estimate provided by LSA in the Transportation Impact Analysis for the Project, the proposed Project is estimated to generate approximately 2,097 residents during the Project's operational phase.[1] Dividing this number of estimated residents generated by the Project by the total annual operational GHG emissions at Project buildout yields approximately 2.42 MT CO_2e/SP/Year, which is below the 2.62 MT CO_2e/SP/year in the 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Construction emissions, when amortized[2], would equal approximately emissions 25.9 MT CO_2e, which is equivalent to approximately 0.01 MT CO_2e/SP/Year. Therefore, the total annual GHG emissions at Project buildout would still yield approximately 2.43 MT CO_2e/SP/Year, after inclusion of the amortized construction emissions.

Therefore, development of the proposed Project would have a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to greenhouse gas emissions would result in a l**ess than cumulatively considerable contribution**.

---

[1] This estimate is based on the estimate provided by LSA in their Transportation Impact Analysis (LSA, 2023).

[2] The amortization period used for this calculation is 30 years.

Impact 4.10: Cumulative Impact on the Inefficient, Wasteful, or Unnecessary Use of Energy Resources (Less than Significant and Less than Cumulatively Considerable)

The proposed Project would use energy resources for the operation of Project buildings (electricity), outdoor lighting (electricity), for on-road vehicle trips (e.g. gasoline and diesel fuel) rerouted by the proposed Project and from off-road and on-road construction activities associated with the proposed Project (e.g. diesel fuel). Each of these activities would require the use of energy resources. The proposed Project would be responsible for conserving energy, to the extent feasible, and relies heavily on reducing per capita energy consumption to achieve this goal, including through statewide and local measures.

The proposed Project would be in compliance with all applicable federal, State, and local regulations regulating energy usage. For example, PG&E, the electric provider to the proposed Project, is responsible for the mix of energy resources used to provide electricity for its customers, and it is in the process of implementing the statewide RPS to increase the proportion of renewable energy (e.g. solar and wind) within its energy portfolio. PG&E has achieved at least a 33% mix of renewable energy resources in 2020 and is on track to achieve 60% mix of renewable energy by 2030. Other statewide measures, including those intended to improve the energy efficiency of the statewide passenger and heavy-duty truck vehicle fleet (e.g. the Pavley Bill and the Low Carbon Fuel Standard), would improve vehicle fuel economies, thereby conserving gasoline and diesel fuel. These energy savings would continue to accrue over time.

The proposed Project would comply with all existing energy standards and would not be expected to result in significant adverse impacts on energy resources. For these reasons, the proposed Project would not cause an inefficient, wasteful, or unnecessary use of energy resources nor cause a significant impact on any of the threshold as described by the *CEQA Guidelines*. Therefore, development of the proposed Project would have a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to energy resources would result in a l**ess than cumulatively considerable contribution**.

HAZARDS AND HAZARDOUS MATERIALS

The cumulative context for the analysis of cumulative hazards and human health impacts Fresno County, including all cumulative growth therein, as represented by full implementation of each respective General Plan (i.e., Clovis and Fresno County). As discussed in Section 3.8 Hazards and Hazardous Materials, development of the proposed Project would not result in any significant impacts related to this environmental topic with the implementation of the mitigation measures provided in Section 3.8.

Impact 4.11: Cumulative Impact Related to Hazards and Hazardous Materials (Less than Significant and Less than Cumulatively Considerable)

The proposed Project, in conjunction with cumulative development in the region, would include areas designated for a variety of uses as defined by the applicable General Plan. Cumulative development would include continued operation of, or development of, new facilities as allowed under each land use designation. New development would inevitably increase the use of hazardous materials within the region, resulting in potential health and safety effects related to hazardous materials use. For the most part, potential impacts associated with new and future development would be confined to commercial and industrial areas and would not involve the use of hazardous substances in large quantities or that would be particularly hazardous. Incidents, if any, would typically be site specific and would involve accidental spills or inadvertent releases. Associated health and safety risks would generally be limited to those individuals using the materials or to persons in the immediate vicinity of the materials and would not combine with similar effects elsewhere (i.e., construction workers). Hazard-related impacts tend to be site-specific and Project-specific. The Project site is not associated with any existing hazardous materials spills; however, there are numerous areas throughout the County where hazardous conditions are present.

Development of the proposed Project would not result in significant increased risks of hazards in the cumulative setting area, nor would it result in any significant off-site or indirect impacts. Mitigation measures have been included to reduce the risk of on-site hazards associated with the use of on-site hazardous materials. Development of the proposed Project would have a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to hazards and hazardous materials would result in a **less than cumulatively considerable contribution**.

HYDROLOGY AND WATER QUALITY

Potential cumulative issues associated with surface waters can be addressed on a watershed basis, or in the case of groundwater, in the context of a groundwater basin. Because water resources are highly interconnected, the cumulative setting is based on Fresno County, which is located in the Tulare Lake Hydrological Region, which covers about 16,800 square miles and includes all of Kings and Tulare counties and most of Fresno and Kern counties. Cumulative development in this region, including the proposed Project, would impact the water quality and hydrological features of the Tulare Lake Hydrologic Region. Clovis is underlain by the Kings Groundwater Subbasin. The Kings Subbasin is bounded on the north by the San Joaquin River, on the west by the Delta-Mendota and Westside Subbasins, the south by the Kings River South Fork and the Empire West Side Irrigation District, and on the east by the Sierra Nevada foothills. Any matter that may affect water quality draining from the Project site will eventually end up in the Delta or within the groundwater basin.

Impact 4.12: Cumulative Increases in Peak Stormwater Runoff from the Project site (Less than Significant and Less than Cumulatively Considerable)

Development of the proposed Project would increase the amount of impervious surfaces in the Project site, which could increase peak stormwater runoff rates and volumes on and downstream on the Project site. However, the proposed Project includes an extensive system of on-site stormwater collection facilities to accommodate the increased stormwater flows that would originate in the Project site.

The proposed stormwater collection system functions through storm drainage collection, treatment, and discharge. The exact sizing of the underground piping will be engineered during the preparation of the improvement plans, which will be in coordination with FMFCD. The proposed storm drainage collection and detention system will be subject to the State Water Resources Control

Board Requirements (SWRCB), City of Clovis regulations; Phase II, National Pollutant Discharge Elimination System (NPDES) Permit Requirements; NPDES-MS4 Permit Requirements; and LID Guidelines.

Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of the FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a **less than significant** impact relative to this topic. As such, impacts related to stormwater runoff would result in a **less than cumulatively considerable contribution**.

Impact 4.13: Cumulative Impacts Related to Degradation of Water Quality (Less than Significant and Less than Cumulatively Considerable)

The San Joaquin River is specifically listed by the Central Valley Regional Water Quality Control Board (CVRWQCB) as an impaired water body due to mercury under the Clean Water Act. Mercury is a sediment-based pollutant that can be released into the water column during various in-water construction activities (e.g., construction of the storm drain outfall) that may disturb the sediment and cause turbidity. As a result, such activities may increase the likelihood of mercury exposure to the public and wildlife that utilize the San Joaquin River.

In accordance with the NPDES Stormwater Program, the Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, and runoff during construction activities. Such BMPs may include: temporary erosion control measures such as silt fences, staked straw bales/wattles, silt/sediment basins and traps, check dams, geofabric, sandbag dikes, and temporary revegetation or other ground cover. The BMPs and overall SWPPP is reviewed by the RWQCB as part of the permitting process. The SWPPP, once approved, is kept on site and implemented during construction activities and must be made available upon request to representatives of the RWQCB and/or the lead agency. The RWQCB has stated that these erosion control measures are only examples of what should be considered and should not preclude new or innovative approaches currently available or being developed. The specific controls are subject to the review and approval by the RWQCB.

The ongoing operational phase of the proposed Project (all phases) requires discharge of stormwater into the on-site detention basins, which would ultimately flow into the FMFCD system. The discharge of stormwater must be treated through BMPs prior to its discharge. The standards and regulations contained above would ensure that BMPs are implemented to reduce the amount of pollution in stormwater discharged from the Project site into the FMFCD system. Storm water drainage is managed through the implementation of BMPs to the extent they are technologically achievable to prevent and reduce pollutants. The City requires reasonable protection from accidental discharge of prohibited materials or other wastes into the municipal storm drain system or watercourses. The management of water quality through BMPs is intended to ensure that water quality does not degrade to levels that would violate water quality standards.

The use of BMPs is intended to treat runoff close to the source during the construction and long-term operational phase of the Project to reduce stormwater quality impacts. The required erosion control measures are existing regulatory requirements. Development of proposed Project would have a **less than significant** impact relative to this topic. As such, impacts related to water quality would result in a **less than cumulatively considerable contribution**.

Impact 4.14: Cumulative Impacts Related to Degradation of Groundwater Supply or Recharge (Less than Significant and Less than Cumulatively Considerable)

The proposed Project would result in new impervious surfaces and could reduce rainwater infiltration and groundwater recharge. Infiltration rates vary depending on the overlying soil types. In general, sandy soils have higher infiltration rates and can contribute to significant amounts of ground water recharge; clay soils tend to have lower percolation potential; and impervious surfaces such as pavement, significantly reduce infiltration capacity and increase surface water runoff.

The infiltration rate of the soils on the Project site ranges from low to high. As indicated in the Geotechnical Report (Krazan & Associates, 2019), cemented silty sand and silty sand with trace clay, locally referred to as "hardpan," were encountered in several of the borings at the Project site. This cementation inhibits infiltration of surface water into the soil stratum below the hardpan. Therefore, it can be presumed that the Project site generally does not allow for a high level of groundwater recharge in its existing condition. Development of the Project site with impervious surfaces is unlikely to reduce rainwater infiltration and groundwater recharge when compared to existing conditions. The open space areas of the development totaling approximately 5.54 acres will remain largely pervious. The collection of rainwater for those areas of impervious surfaces will be routed into the proposed Project's storm drainage system and eventually flow into the San Joaquin River.

The Project site is located in the Kings Groundwater Subbasin. As previously stated, the Kings Subbasin is recharged by water from sources including streams, percolation of rainfall and irrigation water, inflow from other groundwater basins, and intentional recharge at numerous facilities. Intentional recharge is conducted in recharge ponds and on some farm fields with compensation to landowners. The hardpan encountered on the Project site generally does not allow for a high infiltration rate. While the proposed Project would result in an increase in the amount of impervious surfaces within the Project site when compared to existing conditions, it is not anticipated that the proposed development would interfere with groundwater recharge, as much of the groundwater recharge in the basin occurs in the sand and gravels along the San Joaquin River from the Sierra Nevada snowmelt flowing downstream.

Water Supply, including any new demand on groundwater, is fully discussed in Section 3.14 Utilities and Services Systems. The Kings sub basin groundwater sustainability plan GSP has been accepted and approved to be in compliance by the Department of Water Resources. The proposed Project does not conflict with this GSP.

For the reasons mentioned above, the proposed Project would not cause the substantial depletion of groundwater supplies, interfere substantially with groundwater recharge, or conflict with the GSP. As such, development of the proposed Project would have a **less than significant** impact relative to this topic. As such, impacts related to groundwater supply or recharge would result in a **less than cumulatively considerable contribution**.

Impact 4.15: Cumulative Impacts Related to Flooding (Less than Significant and Less than Cumulatively Considerable)

As shown on Figure 3.9-2, the majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) map according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, development of the proposed Project would have a **less than significant** and **less than cumulatively considerable** impact relative to this topic.

LAND USE, POPULATION, AND HOUSING

The cumulative setting for land use and population impacts is the City of Clovis.

Impact 4.16: Cumulative Impact on Communities and Local Land Uses (Less than Significant and Less than Cumulatively Considerable)

Cumulative land use impacts, such as the potential for conflicts with adjacent land uses and consistency with adopted plans and regulations, are typically site- and Project-specific. As shown in Table 3.10-3, the Project is consistent with the City's existing General Plan policies and would not conflict with policies adopted to avoid or mitigate an environmental effect. When land uses are not consistent with a General Plan, there are two courses of action: 1) the uses are not allowed due to the inconsistency, or 2) the land uses are changed through an amendment to the General Plan to create consistency. The proposed Project will require a General Plan Land Use Amendment to adjust the land uses from Rural Residential (RR) to Medium High Density (MH) for the Development Area to accommodate the proposed development density. The proposed General Plan land use designations for the Project site is shown on Figure 2.0-8 of Chapter 2.0: Project Description.

Approval of the General Plan amendment would ensure that the proposed Project would be substantially consistent with the Clovis General Plan land use requirements.

Approval of the General Plan amendment would ensure that the proposed Project would be substantially consistent with the Clovis General Plan land use requirements and would have a **less than significant** and **less than cumulatively considerable** impact relative to the Clovis General Plan.

The Clovis Zoning Code implements the General Plan. The Project site is currently within the jurisdiction of Fresno County. The Fresno LAFCo will require the Project site to be pre-zoned by the City of Clovis in conjunction with the proposed annexation. The pre-zoning request is for the R-1-PRD zoning designations over these lots.

- Single-Family Planned Residential Development Zoning (R-1-PRD). This designation identifies areas appropriate for single-family small lot uses, including attached and detached single-family structures on small lots. The allowable density range is 4.1 to 15.0 units per acre, with the level of density determined by compliance with performance standards. The R-1-PRD district required a planned development permit. The R-1-PRD district is consistent with the Medium and Medium-High Density Residential land use designation of the General Plan.

The proposed City of Clovis zoning for the Project site is shown on Figure 2.0-9.

The pre-zoning would go into effect upon annexation into the City of Clovis. These proposed zone changes would ensure that zoning will be consistent with the proposed General Plan designations within the Project site (Development Area). The zoning ordinance establishes permitted uses, development densities and intensities, and development standards through the R-1-PRD zone district and planned development permit process to ensure that public health, safety, and general welfare are protected, consistent with the purpose of the Zoning Code. All existing City development standards and zoning requirements for the proposed zoning are applicable to any activities on the Project site. The City will review each component of the proposed Project as plans (improvement plans, building plans, site plans, etc.) are submitted for final approval to ensure that they are consistent with the City's Zoning ordinance. Approval of the pre-zoning will ensure that the proposed Project will be consistent with the Zoning Code and will have a **less than significant** and **less than cumulatively considerable** impact relative to the Clovis General Plan.

In addition, the Fresno LAFCo policies discussed in Chapter 3.10: Land Use and Population are intended to ensure orderly reorganization to local jurisdictional boundaries, including annexations. Ultimately, LAFCo will determine whether the proposed annexation would first require an update to the *Clovis Municipal Service Review* in order to approve the annexation. This LAFCo policy was not specifically adopted to avoid or mitigate an environmental effect, rather it is intended to ensure orderly and logical reorganization to local jurisdiction boundaries, including annexations. The proposed Project is consistent with LAFCo policies adopted to address environmental impacts. As such, development of the proposed Project will have a **less than significant** and **less than cumulatively considerable** impact relative to this topic.

Impact 4.17: Cumulative Impacts on Population and Housing (Less than Significant and Less than Cumulatively Considerable)

As described in Section 3.10, the Development Area primarily contains farmland. Three residential dwellings and a warehouse were removed in approximately 2020. The majority of the Development Area is in active agricultural use. Development of the Project would add up to 605 residential units. Therefore, because no housing is located in the Development Area, the proposed Project would not displace substantial numbers of people or existing housing.

Using the most recent Department of Finance (2022) estimate for the average number of persons residing in a dwelling unit in the City of Clovis of 2.81, the addition of up to 605 housing units could increase the population of the City by an estimated 1,700 persons.

The proposed Project will require a General Plan Land Use Amendment to adjust the land uses from Rural Residential (RR) to Medium High Density (MH) for the Development Area to accommodate the proposed development density.

- **Medium High Density (MH).** This designation identifies areas appropriate small lot single family detached homes, townhouses, duplexes, and apartments. The allowable density range is 7.1 to 15.0 units per acre.

While the proposed Project will result in growth, it is not anticipated to significantly induce growth. development of the proposed Project will have a **less than significant** impact relative to this topic. As such, impacts related to population and housing would result in a **less than cumulatively considerable contribution**.

NOISE

The cumulative context for noise impacts associated with the proposed Project consists of the existing and future noise sources that could affect the Project or surrounding uses. Noise generated by construction would be temporary, and would not add to the permanent noise environment or be considered as part of the cumulative context.

Impact 4.18: Cumulative Exposure of Existing and Future Noise-Sensitive Land Uses to Increased Noise Resulting from Cumulative Development (Less than Significant with Mitigation and Less than Cumulatively Considerable)

NOISE IMPACTS TO ON-SITE RECEPTORS DUE TO PROJECT GENERATED TRAFFIC

The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses, but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls. These walls must be at least 4.2 lbs/ft^2. Any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows, which would not be shielded by the 6- foot sound walls.

OPERATIONAL NOISE INCREASES

The proposed Project would include typical residential noise sources which would be compatible with the adjacent existing residential uses (a.k.a. neighborhood traffic, yard equipment, truck deliveries, garbage collected, etc.). Proposed neighborhood parks are located internal to the Project site and would not impact off-site residential uses.

EXTERIOR TRAFFIC NOISE AT PROPOSED USES

The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan. Thus, this is considered a potentially significant impact.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls as required by Mitigation Measure 3.11-3. Furthermore, as required by Mitigation Measure 3.11-4, any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6- foot sound walls. Implementation of Mitigation Measure 3.11-3 and Mitigation Measure 3.11-4 would ensure that these potential impacts are reduced to a **less than significant** level.

INTERIOR NOISE IMPACTS AT PROPOSED RESIDENTIAL USES

Modern construction typically provides a 25-dB exterior-to-interior noise level reduction with windows closed. Therefore, sensitive receptors exposed to exterior noise of 70 dB L_{dn}, or less, will typically comply with the City of Clovis 45 dB L_{dn} interior noise level standard. Additional noise reduction measures, such as acoustically-rated windows, are generally required for exterior noise levels exceeding 70 dB L_{dn}.

As mentioned before, the Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. Based upon a

25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to be approximately 44 dB L_{dn}. Therefore, this is a **less than significant** impact.

CONSTRUCTION NOISE

During the construction of the Project, including roads, water, sewer lines, and related infrastructure, noise from construction activities would add to the noise environment in the Project vicinity. Construction noise is considered a short-term impact and would be considered significant if construction activities are taken outside the allowable times as described in the City of Clovis Municipal Code Section 5.27.604. Construction is anticipated to occur during the permissible hours according to the City's Municipal Code. Construction noise will have a temporary or periodic increase in the ambient noise level above the existing within the Project vicinity. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Noise levels will be the loudest during the grading phase. The modeling assumes construction equipment as close as 25 feet from the adjacent residences and an average of 550 feet away from the adjacent residences. Unmitigated noise levels at 550 feet have the potential to reach 60 dBA Leq and 92 dBA Lmax at the nearest sensitive receptors during grading. Noise levels for the other construction phases would be lower, approximately from 46 to 59 dBA Leq and 86 to 93 dBA Lmax. This would be a 13 dB Leq daytime increase in the ambient noise level at the residents along Perrin Rd., Purdue Ave., Fowler Ave., and East Lexington Ave.

Furthermore, noise reduction policies within the General Plan and standards within the Municipal Code are provided to further reduce construction noise. Therefore, with implementation of the following mitigation measure will ensure that these potential impacts are reduced to a **less than significant** level.

CONCLUSION

With implementation of Mitigation Measure 3.11-1 to 3.11-4, development of the proposed Project would have a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to construction noise would result a **less than cumulatively considerable contribution**.

MITIGATION MEASURE(S)

Implement ***Mitigation Measures 3.11-1 through 3.11-4.***

PUBLIC SERVICES AND RECREATION

Cumulative setting would include all areas covered in the service areas of the Clovis Fire Department (CFD), Clovis Police Department (CPD), the City of Clovis Parks and Recreation Division, the Clovis Unified School District (CUSD), and any other relevant public services.

Impact 4.19: Cumulative Impact on Public Services and Recreation (Less than Significant and Less than Cumulatively Considerable)

Development of the proposed Project would contribute toward an increased demand for public services and facilities within the City of Clovis. It has been determined that the impacts to the CFD, CPD, City of Clovis Parks and Recreation Division, and CUSD, would be less-than-significant. The proposed Project would be subject to all fees that are paid toward the enhancement of public services within the City. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would assist in maintaining existing fire, police, schools, and park services. development of the proposed Project would have a **less than significant** cumulative impact relative to this environmental topic. As such, impacts related to public services would result in a **less than cumulatively considerable contribution**.

TRANSPORTATION AND CIRCULATION

Cumulative Conditions analyses for year 2028 and 2046 were performed to identify potential impacts of the Project under Cumulative AM and PM peak hour conditions. The project trip distribution was developed using select zone model runs obtained from the Fresno COG ABM.

Impact 4.20: Under Cumulative conditions, Project development would result in VMT increases that are greater than 87 percent of Baseline conditions (Cumulatively Considerable and Significant and Unavoidable)

Table 3.13-12 in Section 3.13 presents the existing (2019) Regional and Project VMT per Capita. As shown in Table 3.13-2, the Project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Project design features aim to promote overall mobility with the goal of reducing VMT and reducing greenhouse gas emissions. Implementation of these Project design features may possibly reduce the Project's VMT. The Project design features can help offset some of the VMT impacts of the Project.

Because the development would generate vehicle travel exceeding 15 percent below the established city-wide average under Existing and Cumulative Conditions, even with implementation of Project Design measures that provide mitigating effects, development of the proposed Project would have a **cumulatively considerable contribution** and **a significant and unavoidable** impact.

Impact 4.21: Under Cumulative conditions, the proposed Project would not conflict with a program, plan, policy or ordinance addressing the circulation system, including transit, bicycle, and pedestrian facilities, or increase hazards due to a design feature, incompatible uses, or inadequate emergency access (Less than Significant and Less than Cumulatively Considerable)

The City of Clovis ATP (2022) and City of Clovis General Plan (2014) were reviewed to determine if the proposed Project results in any inconsistencies with adopted transportation related policies.

With recommended improvements described in those chapters, all intersections would operate at LOS D or better with the addition of Project trips. Furthermore, in the absence of a fee program where the Project has an impact on the roadway network, the Project will pay its respective fair share for the proposed improvements. Therefore, development of the proposed Project would not result in a conflict with an existing or planned pedestrian facility, bicycle facility, or transit service/facility.

Additionally, the proposed Project would not conflict with any program, plan, ordinance, or policy addressing the circulation system, substantially increase hazards due to a geometric feature, or result in inadequate emergency access. Therefore, development of the proposed Project would be **less than significant** relative to this topic. The Project would result in a **less than cumulatively considerable contribution** to this topic.

UTILITIES

The cumulative setting includes all areas covered in the service areas of the City's wastewater system, water system, stormwater system, and the solid waste collection and disposal services.

Impact 4.22 Cumulative Impact on Wastewater Utilities (Less than Significant and Less than Cumulatively Considerable)

The proposed Project would increase the amount of wastewater requiring treatment. According to the City's 2017 Wastewater Master Plan Update, single-family residential uses are estimated to generate 55 gallons per capita per day or 175 gallons per day per equivalent dwelling unit (edu). The Project site includes 605 single-family residential units. Using this rate, the proposed Projects would generate approximately 105,875 gallons per day of wastewater. Occupancy of the proposed Project would be prohibited without sewer allocation. An issuance of sewer allocation from the City's available capacity would ensure that there would be a final determination by the wastewater treatment and/or collection provider that there is adequate capacity to serve the proposed Project's projected demand in addition to the provider's existing commitments. Additionally, any planned expansion to the RWTF with a subsequent allocation of capacity to the proposed Project would ensure that there would not be a determination by the wastewater treatment and/or collection provider that there is inadequate capacity to serve the proposed Project's projected demand in addition to the provider's existing commitments.

The Fresno-Clovis Regional Wastewater Treatment Facility is currently in compliance with the WDR requirements of Order No. 5-2013-0080 NPDES NO. CA00883500. The projected flows of the proposed Project are not expected to exceed the treatment capacity available for treatment. Full buildout of the proposed Project would slightly increase the existing treatment demand at the RWRF. As described above, the City must also periodically review and update their Utility Master Plans, including the Wastewater Master Plan, and as growth continues to occur within the City, the City will identify necessary system upgrades and capacity enhancements to meet growth, prior to the approval of new development. These pre-existing proactive efforts ensure the City would be able to reliably treat the wastewater as the community expands its population up to and through the next plant expansion, including with development of the proposed Project.

The City General Plan designates the Development Area as Rural Residential and therefore anticipated potential development. Given that projected wastewater generation volumes associated with the buildout of the Development Area would not exceed the projected wastewater generation volumes described in the Wastewater Master Plan and the Urban Water Management Plan, a described under Impact 3.14-1. Development of the proposed Project would have a **less than significant** and **less than cumulatively considerable** impact relative to this topic.

The wastewater collection and conveyance system that will serve the proposed Project will consist of engineered infrastructure consistent with the City's existing infrastructure requirements. New wastewater collection and conveyance infrastructure needed for the proposed Project will require trenching/excavation of earth, and placement of pipe within the trenches at specific locations, elevations, and gradients. The applicant will refine the wastewater collection/conveyance infrastructure design through the development of improvements plans which undergo review by the Engineering Department to ensure consistency with the City's engineering standards. This improvement plan process will include full engineering design (i.e. location, depth, slope, etc.) of all conveyance infrastructure as well as a review of new sewer pump stations and new force mains if needed. Ultimately, the sanitary sewer collection system will be an underground collection system installed as per the City of Clovis standards and specifications.

Therefore, the installation of the wastewater collection and conveyance system infrastructure to serve the proposed Project would have a less than significant impact relative to this topic. The wastewater treatment plant would not require upgrades or improvements in order to serve the proposed Project. Therefore, development of the proposed Project would have a **less than significant** and **less than cumulatively considerable** impact relative to this topic.

Impact 4.23: Cumulative Impact on Water Utilities (Less than Significant and Less than Cumulatively Considerable)

The Project area will be annexed to the City and will require an extension of existing potable and non-potable systems. The proposed water system will be located within the proposed public utilities easements and be connected to existing City mains and will comply with City Master Plans and standards. The City of Clovis provides water supplies to the City of Clovis. The City has three main water supply sources: groundwater, surface water, and recycled water. The City extracts groundwater from the Kings Subbasin. Surface water is delivered to the City by the Fresno Irrigation District (FID). The various surface water supplies are from the Kings River and Central Valley Project. The City's Water Reuse Facility produces tertiary treated effluent that can be used for agriculture or landscape irrigation.

The proposed Project site will provide an adequate potable and non-potable water distribution systems in strict accordance with City Master Plans and standards. Furthermore, the construction of the new water facilities, which are associated with future buildout of the proposed Project, has the potential to cause environmental impacts. The potential for environmental impacts associated with the installation of the water system and all construction activities within the Development Area of the Project Site, are addressed throughout this EIR. In some cases, the direct and indirect impacts are potentially significant and warrant mitigation measures, while in other cases there are significant and unavoidable impacts. The future water infrastructure would fall within the range of environmental impacts disclosed in this EIR, and would be subject to relevant mitigation measures included in this EIR. The environmental impacts of constructing and operating the new water distribution infrastructure are discussed in Chapters 3.1 through 3.9, 3.14, and 4.0 of this Draft EIR. Therefore, development of the proposed Project would have a less than significant impact relative to this topic.

Projected Water Demand for the Proposed Project: Water would be delivered to the Project via the City's existing and planned distribution system. The Project will receive water supply from the City's water distribution system, which relies on both groundwater and surface water supplies. According to the Water Supply Assessment prepared for the proposed Project, the proposed Project has an associated Land Use-based Water Demand Factor (WDF of 3.3 AFY/acre associated with Medium High Density Residential (MHDR) based on the City's UWMP. The projected water demand for the proposed Project is shown in Table 4.0-2, below. The total projected annual potable water demand for the Project is projected to be 255.8 AFY.

TABLE 4.0-2: PROJECTED WATER DEMAND FOR BUILDOUT OF THE PROPOSED PROJECT

LAND USE	*UNIT FACTOR*	*ACREAGE*	*WATER DEMAND (AFY)*
Medium High Density Residential (MHDR)	3.3	77.5	255.8
Total	**--**	**77.5**	**255.8**

NOTES: BASED ON LAND USE-BASED WATER DEMAND FACTOR (WDF) OF 0.7 AFY/ACRE. AFY = ACRE-FEET PER YEAR.

SOURCE: TRACT 6205, NORTHWEST SPHERE OF INFLUENCE EXPANSION AREA. WATER SUPPLY ASSESSMENT (PROVOST & PRITCHARD CONSULTING GROUP, 2022).

As shown in table 4.0-2, the total proposed water demand amounts to approximately 1.6% of the excess supply for year 2030 the City has in a normal year as shown in Table ES-3 of the 2020 UWMP. This indicates an ability of the City to serve this project in the interim while additional supplies are acquired to accommodate full build-out of the GP.

Projected Water Supply for the Proposed Project: Water demands for the proposed Project will be served using the City's existing and future portfolio of water supplies. The inclusion of existing and planned future supplies is specifically allowed by the Water Code:

> *Water Code section 10631(b): Identify and quantify, to the extent practicable, the existing and planned sources of water available to the supplier over the same five-year increments described in subdivision (a).*

The applicants for the proposed Project will provide their proportionate share of required funding to the City for the acquisition and delivery of treated potable water supplies to the Project site.

Determination of Water Supply Sufficiency Based on the Requirements of SB 610: Water Code section 10910 states:

> *10910(c)(4) If the city or county is required to comply with this part pursuant to subdivision (b), the water supply assessment for the project shall include a discussion with regard to whether the total projected water supplies, determined to be available by the city or county for the project during normal, single dry, and multiple dry water years during a 20-year projection, will meet the projected water demand associated with the proposed project, in addition to existing and planned future uses, including agricultural and manufacturing uses.*

Pursuant to Water Code section 10910(c)(4) and based on the technical analyses described in the UWMP, the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project as shown in table 4.0-2, in addition to existing and planned future uses.

A comparison of the City's projected potable and raw water supplies and demands is shown in Table 4.0-3, below, for Normal, Single Dry, and Multiple Dry Years. Demand within the City's service area is not expected to exceed the City's supplies in any Normal year between 2020 and 2040. From this analysis, the City's water demands are not expected to exceed water supplies in Single Dry Years or Multiple Dry Years.

TABLE 4.0-3: SUMMARY OF POTABLE AND RAW WATER DEMAND VERSUS SUPPLY DURING HYDROLOGIC NORMAL, SINGLE DRY, AND MULTIPLE DRY YEARS

Hydrologic Condition		*Supply and Demand Comparison, AFY*			
		2025	*2030*	*2035*	*2040*
Normal Year					
Available Potable and Raw Water Supply		50,739	58,937	65,034	74,650
Total Water Demand		39,737	42,824	46,422	52,598
Potential Surplus (Deficit)		11,002	16,113	18,612	22,052
Supply Shortfall, Percent of Demand		-	-	-	-
Single Dry Year					
Available Potable and Raw Water Supply		37,839	43,587	47,233	53,109
Total Water Demand		34,272	37,359	40,957	47,133
Potential Surplus (Deficit)		3,567	6,228	6,276	5,976
Supply Shortfall, Percent of Demand		-	-	-	-
Multiple Dry Year					
Multiple Dry Year 1	Available Potable and Raw Water Supply	46,784	54,607	60,330	68,999
	Total Water Demand	36,489	39,422	42,840	48,707
	Potential Surplus (Deficit)	10,294	15,185	17,489	20,292
	Supply Shortfall, Percent of Demand	-	-	-	-
Multiple Dry Year 2	Available Potable and Raw Water Supply	45,093	52,576	57,958	66,095
	Total Water Demand	34,183	36,962	40,200	45,758
	Potential Surplus (Deficit)	**10,910**	**15,614**	**17,758**	**20,337**
	Supply Shortfall, Percent of Demand	-	-	-	-
Multiple Dry Year 3	Available Potable and Raw Water Supply	41,895	48,310	52,625	59,717
	Total Water Demand	31,346	33,969	37,028	42,277
	Potential Surplus (Deficit)	10,550	14,341	15,597	17,440
	Supply Shortfall, Percent of Demand	-	-	-	-

Multiple Dry Year 4	Available Potable and Raw Water Supply	37,839	43,587	47,233	53,109
	Total Water Demand	28,005	30,474	33,353	38,293

	Supply Shortfall, Percent of Demand	-	-	-	-

SOURCE: PROVOST & PRITCHARD, 2021B.

CONCLUSION

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The proposed Project would not result in insufficient water supplies available to serve the Project from existing entitlements and resources. Therefore, the proposed Project would result in a **less than significant** and **less than cumulatively considerable** impact relative to this topic.

Impact 4.24: Cumulative Impact on Stormwater Facilities (Less than Significant and Less than Cumulatively Considerable)

The proposed Project includes development of a new storm drainage system to serve the proposed uses as described above. The construction of the new on-site stormwater drainage facilities, which are associated with future buildout of the Development Area of the Project Site, has the potential to cause environmental impacts. The potential for environmental impacts associated with the installation of the stormwater system, and all construction activities within the Development Area, are addressed throughout this EIR. In some cases, the direct and indirect impacts are potentially significant and warrant mitigation measures, while in other cases there are significant and unavoidable impacts. The future storm drainage infrastructure would fall within the range of environmental impacts disclosed in this EIR, and would be subject to relevant mitigation measures included in this EIR. All mitigation measures presented throughout this EIR will be implemented to reduce impacts to the extent practicable. There will not be any significant impacts beyond what is disclosed in the other chapters of this document. In addition to the other mitigation measures presented throughout this document, the following mitigation measure is intended to ensure that the drainage system is designed and constructed to meet the City's performance standards. The plan will include an engineered storm drainage plan that demonstrates attainment of pre-Project runoff requirements prior to discharge and describes the treatment controls used to reach attainment consistent with the City's performance standards. With implementation of Mitigation Measure 3.14-1, as provided in Section 3.14: Utilities of this EIR, development of the proposed Project would have a **less than significant** and **less than cumulatively considerable** impact relative to this topic.

Impact 4.25: Cumulative Impact on Solid Waste Facilities (Less than Significant and Less than Cumulatively Considerable)

As previously described, permitted maximum disposal at the Clovis Landfill (SWIS Number 10-AA-0004) is 2,000 tons per day. The total permitted capacity of the landfill is 7.8 million cubic yards, of which, 7.74 million cubic yards remain. This landfill has an expected cease operation date in the year 2047. Additionally, the American Avenue Landfill has a maximum permitted capacity of 32,700,000 cubic yards and a remaining capacity of 29,358,535 cubic yards, with an estimated closure date of August 31, 2031. As noted previously, the vast majority of landfill disposed from the City of Clovis went to Clovis Landfill.

The City already utilizes the American Avenue Disposal Site, Avenal Regional Landfill, and Fairmead Solid Waste Disposal Site; in 2019 Clovis disposed of 11,586 tons to the American site, 358 tons to the Avenal site and 1,956 tons to the Fairmead site. (Cal Recycle, 2022C, D, E).

The Avenal Regional Landfill has the furthest operation date; the landfill is expected to operate until March of 2056. Avenal has a remaining capacity of 28,900,000 cubic yards, and has a current maximum permitted throughput of 6,000 tons per day.

New residential land uses in the Development Area of the Project site would increase the amount of solid waste generated by residents. The increase in growth and development as a result of the development of the proposed Project could result in an increase of solid waste to transfer stations and landfills, and could contribute to an increased demand for solid waste services throughout the City. Solid waste generated by the proposed Project was estimated based on CalRecycle generation rate estimates by use. Per CalRecycle generation rate estimates, the Development Area is estimated to generate roughly 12 pounds per household per day[3]. It is estimated that the proposed 605 residential units would generate approximately 7,400 pounds per day of solid waste. The total solid waste generated by the proposed Project is estimated to be 3.4 tons per day. This equates to roughly 0.17 percent of the total allowable daily maximum disposal at the Clovis Landfill and would not cause an exceedance of the landfill's remaining capacity. Therefore, the City's projected increase in solid waste generation associated with future buildout of the proposed Project is expected to be within the permitted capacities of landfills utilized by the City. Based on the estimated closure dates of the Clovis Landfill in 2047 and the American Avenue Landfill in 2031, development under the proposed Project would not result in a significant impact on landfill capacity. This is a **less than significant** impact. Thus, impacts related to solid waste facilities would be a **less than cumulatively considerable contribution**.

Impact 4.26: Cumulative Impact from Electrical, or Telecommunications Facilities (Less than Significant and Less than Cumulatively Considerable)

Electrical services are provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along Shepherd Avenue and from existing residential development surrounding the Project

---

[3] Note: data based on CalRecycle estimated solid waste generation rates for single family residential uses.; 12.23 lbs/household/day. (CalRecycle, 2022A).

site. PG&E and AT&T operate and maintain transmission and distribution infrastructure in the Project area. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Although the proposed Project would increase demand for electricity, and telecommunications facilities, utility improvements would be installed in conjunction with planned street improvements. Although the Project would require construction of new electrical facilities within the site, these improvements would be limited to connections to existing facilities near the Project site. The potential environmental effects associated with construction and operation of the proposed Project, including the installation of the proposed electrical improvements in the roadway rights-of-way to serve the proposed development, are analyzed throughout this EIR under each environmental topical area. The proposed Project would not result in the relocation or construction of new or expanded electrical, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects. This is a **less than significant** impact. Thus, impacts related to solid waste facilities would be a **less than cumulatively considerable contribution**.

4.2 SIGNIFICANT IRREVERSIBLE EFFECTS

LEGAL CONSIDERATIONS

CEQA Section 15126.2(c) and Public Resources Code Sections 21100(b)(2) and 21100.1(a), require that the EIR include a discussion of significant irreversible environmental changes which would be involved in the proposed action, should it be implemented. Irreversible environmental effects are described as:

- The project would involve a large commitment of nonrenewable resources;
- The primary and secondary impacts of a project would generally commit future generations to similar uses (e.g., a highway provides access to previously remote area);
- The project involves uses in which irreversible damage could result from any potential environmental accidents associated with the project; or
- The phasing of the proposed consumption of resources is not justified (e.g., the project involves the wasteful use of energy).

Determining whether the proposed Project would result in significant irreversible effects requires a determination of whether key resources would be degraded or destroyed such that there would be little possibility of restoring them. Irretrievable commitments of resources should be evaluated to assure that such current consumption is justified.

Consumption of Nonrenewable Resources

Consumption of nonrenewable resources refers to the loss of physical features within the natural environment, including the conversion of agricultural lands, loss of access to mining reserves, and nonrenewable energy use. The Project site has nonrenewable resources, including biological resources and agricultural resources.

As discussed in Section 3.4, Biological Resources, all impacts would be less than significant or less than significant with implementation of mitigation measures. As a result, the proposed Project will minimize the potential for impacts to the nonrenewable resources on the Project site, including biological resources and water resources, to the greatest extent feasible. More detailed and focused discussions of potential impacts to these nonrenewable resources are contained throughout this Draft EIR.

Nonrenewable agricultural resources such as agricultural land, farmland, and agricultural soils, would be converted during the construction and operation of the Project. The City's General Plan includes a variety of policies that seek to conserve and protect agricultural resources. These include policies that encourage the development of vacant lands within City boundaries prior to conversion of agricultural lands and ensure that urban development near existing agricultural lands will not unnecessarily constrain agricultural practices or adversely affect the economic viability of nearby agricultural operations. Nevertheless, as discussed in Section 3.2, Agricultural Resources, impacts related to the conversion of Important Farmland were evaluated using the LESA Model and determined to be less than significant.

Irretrievable Commitments/Irreversible Physical Changes

Development of the proposed Project would result in irretrievable commitments by introducing development onto the site which is presently undeveloped. The conversion of agricultural lands to urban uses would result in an irretrievable loss of agricultural land, wildlife habitat, and open space.

A variety of resources, including land, energy, water, construction materials, and human resources would be irretrievably committed for development and infrastructure installation associated with development and operation of the proposed Project. Buildout of the Project would require the commitment of a variety of other non-renewable or slowly renewable natural resources such as lumber and other forest products, sand and gravel, asphalt, petrochemicals, and metals.

Additionally, a variety of resources would be committed to the ongoing operation and life of the Project. The introduction of new residential and park uses to the Project site will result in an increase energy demand associated with building operations, vehicle travel, equipment operation, and other activities. Fossil fuels are the principal source of energy and the Project will increase consumption of available supplies, including gasoline and diesel fuel. These energy resource demands relate to initial construction, operation, maintenance and the transport of people and goods to and from the Project site that would occur with development of the proposed Project.

Additionally, development will physically change the environment in terms of aesthetics, air emission, noise, traffic, open space, and natural resources. These physical changes are irreversible after development occurs.

MANDATORY FINDINGS OF SIGNIFICANCE

CEQA Guidelines Section 15065 states that a lead agency shall find that a project may have a significant effect on the environment where there is substantial evidence that the project has potential environmental effects that are individually limited, but cumulatively considerable. As defined in CEQA Guidelines Section 15065(a)(3), cumulatively considerable means “that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, the effects of other current projects, and the effects of probable future projects.” Cumulative impacts are addressed previously in Section 4.1 for each of the environmental topics.

CEQA Guidelines Section 15065(a)(1) states that a lead agency shall find that a project may have a significant effect on the environment where there is substantial evidence that the project has the potential to (1) substantially reduce the habitat of a fish or wildlife species; (2) cause a fish or wildlife population to drop below self-sustaining levels; or (3) substantially reduce the number or restrict the range of an endangered, rare, or threatened species. These impacts are discussed below.

Additionally, as required by CEQA Guidelines Section 15065(a)(4), a lead agency shall find that a project may have a significant effect on the environment where there is substantial evidence that the project has the potential to cause substantial adverse effects on human beings, either directly or indirectly. These impacts are discussed below.

Substantial Adverse Effects on Fish, Wildlife, and Plant Species

Section 3.4 (Biological Resources) of this Draft EIR fully addresses any impacts that might relate to the reduction of the fish or wildlife habitat, the reduction of fish or wildlife populations, and the reduction or restriction of the range of special-status species as a result of Project development. As described throughout the analysis in this Draft EIR, the proposed Project would not result in any significant impacts that would substantially reduce the habitat of fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, or reduce the number or restrict the range of a rare or endangered plant or animal to the environment. As described in greater detail in Section 3.4 (Biological Resources), any potentially significant impacts related to plant and animal species would be reduced to a less than significant level through implementation of goals, policies and implementation measures provided in the City’s General Plan as well as through adherence to state and federal regulations. Therefore, this is considered a **less than significant** impact.

4.3 SIGNIFICANT AND UNAVOIDABLE IMPACTS

CEQA Guidelines Section 15126.2(b) requires an EIR to discuss unavoidable significant environmental effects, including those that can be mitigated, but not reduced to a level of insignificance. The following significant and unavoidable impacts of the proposed Project are discussed in Sections 3.1, 3.2, and 3.13, and previously in this chapter (cumulative-level). Refer to those discussions for further details and analysis of the significant and unavoidable impact identified below:

- Impact 3.13-1: Project development would not result in VMT increases that are greater than 87 percent of Baseline conditions;

- Impact 4.20: Under Cumulative conditions, Project development would result in VMT increases that are greater than 87 percent of Baseline conditions.

This page left intentionally blank.

5.1 CEQA REQUIREMENTS

The California Environmental Quality Act (CEQA) requires that an Environmental Impact Report (EIR) analyze a reasonable range of feasible alternatives that meet most or all project objectives while reducing or avoiding one or more significant environmental effects of the project. The range of alternatives required in an EIR is governed by a "rule of reason" that requires an EIR to set forth only those alternatives necessary to permit a reasoned choice (CEQA Guidelines Section 15126.6[f]). Where a potential alternative was examined, but not chosen as one of the range of alternatives, the CEQA Guidelines require that the EIR briefly discuss the reasons the alternative was dismissed.

PROJECT OBJECTIVES

The principal Project objective is the expansion of the City's SOI to include the Project site, and the annexation/reorganization, approval and subsequent development of the Development Area.

The quantifiable objectives include the development of up to 605 single-family residential units. The quantifiable objectives include the development of open space totaling approximately 5.54 acres, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks. The Project objectives also include the installation of new public and private roadways that will provide pedestrian and vehicular access to the Project site and surrounding community areas, and other improvements, including water supply, storm drainage, sewer facilities, and landscaping to serve the residential uses.

The goals of the proposed development are as follows:

- Provide residential housing opportunities that are visually attractive and accommodate the future housing demand in Clovis, consistent with policies stated in *A Landscape of Choice* to modestly increase urban density.
- Establish a mixture of housing types, sizes and densities that collectively provide for local and regional housing demand, consistent with City Requirements as stated in the latest Regional Housing Needs Analysis (RHNA).
- Provide infrastructure that meets City standards and is integrated with existing and planned facilities and connections.
- Establish a logical phasing plan designed to ensure that each phase of development would include necessary public improvements required to meet City standards.
- Expand the City's Sphere of Influence in order to establish a logical and orderly boundary that promotes the efficient extension of municipal services.

ALTERNATIVES NOT SELECTED FOR FURTHER ANALYSIS

A Notice of Preparation (NOP) was circulated to the public to solicit recommendations for a reasonable range of alternatives to the proposed Project. Additionally, a public scoping meeting was held during the public review period to solicit recommendations for a reasonable range of alternatives to the proposed Project. No specific alternatives were recommended by commenting agencies or the general public during the NOP public review process.

The City of Clovis considered alternative locations early in the public scoping process. The City's key considerations in identifying an alternative location were as follows:

- Is there an alternative location where significant effects of the Project would be avoided or substantially lessened?
- Is there a site available within the City's Sphere of Influence with the appropriate size and characteristics such that it would meet the basic Project objectives?

The City's consideration of alternative locations for the Project included a review of previous land use planning and environmental documents in Clovis, including the General Plan. The search included a review of land in Clovis that is located within the Sphere of Influence, suitable for development, available for acquisition, and not already approved or pending development. It was found that there are numerous approved projects and proposed projects that are currently under review in Clovis. These approved and proposed projects are not available for acquisition by the Project applicant and are not considered a feasible alternative for the Project applicant. The City has found that there are no feasible alternative locations that exist within the City's Sphere of Influence with the appropriate size and characteristics that would meet the basic Project objectives and avoid or substantially lessen a significant effect. For these reasons, the City of Clovis determined that there are no feasible alternative locations.

5.2 ALTERNATIVES CONSIDERED IN THIS EIR

Four alternatives to the proposed Project were developed based on input from City staff. The alternatives that are anticipated to be analyzed in the EIR include the following four alternatives in addition to the proposed Project.

- **No Project (No Build) Alternative**: Under this alternative, development of the Project site would not occur, and the Project site would remain in its current existing condition.
- **Increased Density Mixed Use Alternative:** Under this alternative, the proposed Project would be developed at a higher density for the residential uses and would also include a mixed-use component to the alternative. Approximately 62 acres would be developed with 605 residential units under the medium-high density residential use, 10 acres would be developed with 195 apartments under the high density residential use, and 5 acres would be developed with 108,000 square feet under the neighborhood commercial use.
- **Reduced Density Alternative:** Under this alternative, the proposed Project would have a reduced density for the residential uses. Approximately 150 residential units would be developed under the very low-density residential designation.

- **Reduced Sphere of Influence Alternative:** Physically, there is little difference between the proposed Project and this alternative. It is noted, however, that the reduction in the SOI would eliminate the possibility of the Non-Development Area connecting to City services at some point in the future, if desired by those residents.

NO PROJECT (NO BUILD) ALTERNATIVE

Under the No Project (No Build) Alternative development of the Project site would not occur, and the Project site would remain in its current existing condition. It is noted that the No Project (No Build) Alternative would fail to meet the Project objectives.

INCREASED DENSITY MIXED USE ALTERNATIVE

Under this alternative, the proposed Project would be developed at a higher density for the residential uses and would also include a mixed-use component to the alternative. Approximately 80 percent of the Development Area (62 acres) would be developed with 605 residential units (9.75 du/ac). This would still fall under the Medium-High Density (MH) 7.1–15.0 du/ac land use category. The remaining 15 acres of the Development Area would be developed with a mix of commercial and higher density residential. The mixed-use area would have 10 acres for High Density (H) 15.1–25.0 du/ac. The alternative assumes 195 apartments constructed at a density of 19.5 du/ac. There would also be 5 acres of Neighborhood Commercial (NC) (Max FAR 0.50). This area would be developed as a neighborhood-scale shopping facility. The FAR would allow for 108,000 square feet of commercial. It is anticipated that the commercial would include an anchor store such as a small supermarket with a wide range of ancillary uses including banks, restaurants, service businesses, and other related activities are generally found in these planned commercial centers.

REDUCED DENSITY ALTERNATIVE

Under this alternative, the proposed Project would have a reduced density in the Development Area that would fall under the Very Low Density (VL) 0.6–2.0 du/ac land use. The alternative assumes 150 residential units at approximately 2 du/ac. This use is described as large lot single-family residences and appurtenant structures within an identifiable residential neighborhood. This alternative would include neighborhood parks and all the infrastructure necessary to connect to City services.

REDUCED SPHERE OF INFLUENCE ALTERNATIVE

Under this alternative, the proposed Project would only expand the Sphere of Influence and annex the Developed Area and would exclude the 78-acre Sphere of Influence (SOI) expansion to the north and east of the Development Area. Physically, there is little difference between the proposed Project and this alternative. It is noted, however, that the reduction in the SOI would eliminate that possibility of the Non-Development Area connecting to City services at some point in the future, if desired by those residents.

5.3 ENVIRONMENTAL ANALYSIS

The alternatives analysis provides a summary of the relative impact level of significance associated with each alternative for each of the environmental issue areas analyzed in this EIR. Following the analysis of each alternative, Table 5.0-1 summarizes the comparative effects of each alternative.

NO PROJECT (NO BUILD) ALTERNATIVE

Aesthetics and Visual Resources

The No Project (No Build) Alternative would leave the Project site in its existing state and would not result in increases in daytime glare or nighttime lighting. The visual character of the Project site would not change under this alternative compared to existing conditions.

As described in Section 3.1, the visual character of the Project site would be altered as a result of Project implementation. Implementation of the City's design standards would ensure quality and cohesive design of the Project site. These standards include specifications for building height, massing, and orientation, exterior lighting standards, and landscaping standards. Following the City's design requirements will produce a project that will be internally cohesive, while maintaining and aesthetic feel similar to that of the surrounding uses. The Clovis General Plan EIR concluded that adoption of the General plan, which contemplated urbanization of the lands within the General Plan study area, was a less than significant environmental impact.

There are no designated State Scenic Highways in the vicinity of the Project site. No officially designated State scenic highways are located in the City of Clovis. The nearest eligible State scenic highway to the City is State Route 168, which is located in Fresno County northeast of the City of Clovis. The City of Clovis and the Project site are not visible from this roadway segment. Additionally, there are no "eligible" highway segments in the Project vicinity that may be included in the State Scenic Highway system.

The proposed Project would be required to implement existing City regulations aimed at reducing light and glare impacts to ensure that no unusual daytime glare or nighttime lighting is produced. Specifically, the Clovis Development Code states that direct glare shall not be permitted and provides standards for nuisance prevention and shielding requirements. Section 9.22.050 of the Clovis Development Code contains standards and provisions related to exterior lighting. Implementation of regulations and standards within the Clovis Development Code would reduce impacts associated with increased light and glare to a less than significant level.

Overall, the proposed Project would not substantially impact the visual character or quality of the Project site or its surroundings, damage scenic resources within a State Scenic Highway, or potentially significant new sources of light and glare. The No Project (No Build) Alternative would avoid these less than significant impacts altogether. As such, this impact would be reduced when compared to the proposed Project.

Agricultural Resources

Currently, the majority of the Project site is vacant agricultural land. Development of the proposed Project would result in the permanent conversion of approximately 63.60 acres of Prime Farmland and 11.44 acres of Farmland of Statewide Importance, as designated by the California Department of Conservation on the June 2020 Important Farmlands Map to nonagricultural use. The California Land Evaluation and Site Assessment (LESA) Model was utilized to determine the proposed Project's potential impact on agricultural resources. The LESA scoring for the proposed Project shows that the conversion of the land on the Project site is not considered significant according to the California Department of Conservation's established thresholds.

The Project site is not under a Williamson Act Contract, and the proposed pre-zoning is consistent with the urban uses anticipated by the City under the adopted General Plan. There is no immediately adjacent agricultural land that poses a potential for conflict. Development of the proposed Project was found to have a less than significant impact relative to this topic.

The No Project (No Build) Alternative would result in no development on the Project site. As such, this alternative would have no impact on agricultural land. As such, this impact would be reduced when compared to the proposed Project.

Air Quality

To achieve attainment with the standards, the SJVAPCD has established thresholds of significance for criteria pollutant emissions. Projects with emissions below the thresholds of significance for criteria pollutants would be determined to "Not conflict or obstruct implementation of the District's air quality plan."

CalEEMod^{TM} (v.2020.4.0) was used to model operational emissions of the proposed Project. The SJVAPCD has established their thresholds of significance by which the Project emissions are compared against to determine the level of significance. If the proposed Project's emissions will exceed the SJVAPCD's threshold of significance for operational-generated emissions, the proposed Project will have a significant impact on air quality and all feasible mitigation are required to be implemented to reduce emissions to the extent feasible. It was found that operational emissions would not exceed any of the SJVACPD operational thresholds of significance.

The proposed Project would comply with pre-existing requisite federal, State, SJVAPCD, and other local regulations and requirements, as well as implement the control measures provided by the SJVAPCD for construction-related PM_{10} emissions. Compliance with the existing rules and regulations would ensure that the Project's criteria pollutant emissions would be considered to have a less than significant impact.

Substantial concentrations of carbon monoxide are not expected at or along any streets or intersections affected by the development of the Project site. Residences would not be located within 500 feet of a freeway or high-traffic road, or be within any of the other CARB minimum separation recommendations on siting sensitive land uses. Regardless, the proposed Project would not have land uses that would generate a significant risk of public exposure to TACs.

Under the No Project (No Build) Alternative, the Project site would not be developed, and there would be no net change in emissions and no potential for a conflict with any adopted plans or policies related to air quality. As such, this impact would be reduced when compared to the proposed Project.

Biological Resources

The biological analysis showed that there were no special-status invertebrates, or their habitat, observed within the Project site during field surveys and none are expected to be affected by the proposed Project. The Project site also does not contain suitable aquatic or upland habitat for special status reptiles or amphibians known to occur in the region. It was determined during the field survey that the agricultural disturbance on the Project site precludes the existence of special-status plants, unless agricultural operations were to cease. The Project site does not contain protected wetlands or other jurisdictional areas and there is no need for permitting associated with the Federal or State Clean Water Acts. There are no sensitive natural communities within the Project site. The land uses within the Project site would not have any direct disturbance to the San Joaquin River or its tributaries, and therefore, would not have any direct disturbance to the movement corridor or habitat. The proposed Project is not subject to a Habitat Conservation Plan. The proposed Project requires the removal of the pecan orchard within the Development Area. Pecan trees are fruit trees and are, thus, exempt from the tree removal and replacement requirements.

The Project would result in the removal of an orchard, which is not high-quality nesting or foraging habitat for special-status birds. Powerlines and trees located in the region represent potentially suitable nesting habitat for a variety of special-status birds. Additionally, the agricultural land with low growing crops or grasslands represents potentially suitable nesting habitat for the ground-nesting birds. In general, most nesting occurs from late February and early March through late July and early August, depending on various environmental conditions. The CNDDB does not provide any records of special status birds on the Project site or in the immediate vicinity. Nevertheless, birds are highly mobile and can be expected to fly over the Project site at times. They could use the site for foraging, although it is not high-quality habitat for foraging. The Project site does not contain high quality nesting habitat for special status birds given that it is an orchard.

New sources of noise and light during the construction and operational phases of the Project could adversely affect nesters if they located adjacent to the Project site in any given year. Additionally, the proposed Project would eliminate the open undeveloped land on the Project site, which could serve as limited foraging habitat for birds throughout the year. Mitigation Measure 3.4-1 requires preconstruction surveys for active nests of special-status birds and buffers around nests should they be identified during the surveys. Development of the proposed Project, with the Mitigation Measure 3.4-1, would ensure that potential impacts to special-status birds are reduced to a less than significant level.

Development of the Project site would eliminate foraging habitat for special-status bats by removing the agricultural areas. These special-status bat species, or evidence of bat presence (i.e. guano), were not observed during the field surveys and have not been documented on the Project site; therefore, they are not expected to be directly affected. Implementation of Mitigation Measure 3.4-2 requires surveys for active maternity roosts if removal of suitable roosting areas (i.e., buildings, trees, shrubs, bridges, etc.) must occur during the bat pupping season (April 1 through July 31). If a special-status bat maternity roost is located, appropriate buffers around the roost sites would be required. Therefore, development of the proposed Project with Mitigation Measure 3.4.2, would ensure that potential impacts to special status bat species are reduced to a less than significant impact.

Under the No Project (No Build) Alternative, the proposed Project would not be constructed, no habitat would be removed and no ground disturbing activities would occur. As such, this impact would be reduced when compared to the proposed Project.

Cultural and Tribal Resources

The Project site encompasses approximately 77-acre for physical development and 78 acres for non-development entitlements. The Project site is not located in an area known to have historical and archaeological resources, however, as with most projects in the region that involve ground-disturbing activities, there is the potential for discovery of a previously unknown historical and archaeological resources. Implementation Mitigation Measure 3.5-1 would ensure that this impact is less than significant. Additionally, while no human remains were found during field surveys of the Project site, implementation of the Mitigation Measure 3.5-1 would ensure that all construction activities, which inadvertently discover human remains implement state-required consultation methods to determine the disposition and historical significance of any discovered human remains. Implementation of Mitigation Measure 3.5-1 would ensure that the potential impact to disturb human remains, including those interred outside of formal cemeteries to a less than significant level.

The City of Clovis sent outreach letters to the twelve tribal representatives listed in the NAHC response. While no specific resources have been identified through consultation with affiliated tribes, it is possible that unknown tribal cultural resources may be present within the Development Area. The Proposed Project would be required to follow development requirements, including compliance with local policies, ordinances, and applicable permitting procedures related to protection of tribal resources. Implementation of Mitigation Measure 3.5-1 would ensure that the potential impact to tribal resources*, including human remains, would be* less than significant.

The No Project (No Build) Alternative would result in no ground disturbing activities related to the proposed Project and would not have the potential to disturb or destroy cultural, historic, archaeological, or tribal resources. While the proposed Project is not anticipated to result in significant impacts to cultural resources with mitigation, the No Project (No Build) Alternative would result in less potential for impacts to cultural resources as the entire Project site would continue to be vacant agricultural land. As such, this impact would be reduced when compared to the proposed Project.

Geology and Soils

The Project site is subject to potential ground shaking caused by seismic activity. All construction will be designed in accordance with the latest seismic design standards of the California Building Code. These design standards and requirements are intended to minimize impacts to structures in seismically active areas of California. The Project site has a low risk of seismic-related ground failure as a result of liquefication. Landslide potential on the Project site is also low to non-existent. The Project site does not have a significant risk of becoming unstable as a result landslide, subsidence, soil collapse, liquefaction, liquefaction induced settlement, or lateral spreading. The soils on the Project site have a low shrink-swell potential. A final soils report will be performed at a design-level to ensure that the foundations, structures, roadway sections, sidewalks, and other improvements can accommodate the specific soils, including expansive soils, at those locations.

Septic tanks or septic systems are not proposed as part of the Development Area and will not be installed to serve the Development area. The residences within the Non-development Area are currently on septic systems. There are no new residences proposed in this area, and no new septic systems would be installed. This area would be part of the SOI expansion area, but would not be part of the annexation. At some future date, if those residents decided to annex into the City, they would be required to connect to the City of Clovis wastewater collection and treatment system and destroy the existing septic systems.

The Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and are existing regulatory requirements.

The Project site is not expected to contain subsurface paleontological resources, it is possible that undiscovered paleontological resources could be encountered during ground-disturbing activities. Implementation of Mitigation Measure 3.6-1 would ensure steps would be taken to reduce impacts to paleontological resources in the event that they are discovered during construction, including stopping work in the event potential resources are found, evaluation of the resource by a qualified paleontologist and appropriate handling of any potential resource. This mitigation measure would reduce this impact to a less than significant level.

There are no past or current commercial mining operations within the Project site. Development of the proposed Project would have a less than significant impact relative to this topic.

Under the No Project (No Build) Alternative, the proposed Project would not be constructed, and no ground disturbing activities would occur. As such, this impact would be reduced when compared to the proposed Project.

Greenhouse Gases, Climate Change and Energy

Estimated maximum mitigated GHG emissions associated with construction of the proposed Project are estimated at a maximum of approximately 776.8 MT CO_2e per year. The annual mitigated GHG emissions associated with operations of the proposed Project would be approximately 5,071 MT CO_2e.

The proposed Project is estimated to generate approximately 2,097 residents during the Project's operational phase.[1] Dividing this number of estimated residents generated by the Project by the total annual operational GHG emissions at Project buildout yields approximately 2.42 MT CO_2e/SP/Year, which is below the 2.62 MT CO_2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Construction emissions, when amortized[2], would equal approximately emissions 25.9 MT CO_2e, which is equivalent to approximately 0.01 MT CO_2e/SP/Year. Therefore, the total annual GHG emissions at Project buildout would still yield approximately 2.43 MT CO_2e/SP/Year, after inclusion of the amortized construction emissions.

GHG emissions associated the proposed Project are below the derived GHG threshold; therefore, the proposed Project would not affect statewide GHG reduction goals. The proposed Project would generate GHG emissions, directly and indirectly, that would not exceed the 2.62 MT CO2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Therefore, the proposed Project's greenhouse gas emissions would be considered to have a less than significant impact relative to this topic.

Electricity used by the proposed Project would be used primarily to generate energy for the residential homes, landscape lighting, and street lighting. As shown in the following tables, "Energy" is one of the categories that was modeled for GHG emissions. The total unmitigated and mitigated GHG emissions generated from the "Energy" category during Project operation is 1,231 CO_2e.

The proposed Project would generate operational vehicle trips that would use a total of approximately 2,100 gallons of gasoline and 341 gallons of diesel per day, or 341,321 gallons of gasoline and 69,484 gallons of diesel per year.

The proposed Project would use a total of approximately 18,955 gallons of diesel fuel for off-road construction vehicles.

The proposed Project would use energy resources for the operation of Project buildings (electricity), outdoor lighting (electricity), for on-road vehicle trips (e.g. gasoline and diesel fuel) rerouted by the proposed Project and from off-road and on-road construction activities associated with the proposed Project (e.g. diesel fuel). Each of these activities would require the

---

[1] This estimate is based on the estimate provided by LSA in their Transportation Impact Analysis (LSA, 2023).

[2] The amortization period used for this calculation is 30 years.

use of energy resources. The proposed Project would be responsible for conserving energy, to the extent feasible, and relies heavily on reducing per capita energy consumption to achieve this goal, including through statewide and local measures.

The proposed Project would be in compliance with all applicable federal, State, and local regulations regulating energy usage. For example, PG&E, the electric and natural gas provider to the proposed Project, is responsible for the mix of energy resources used to provide electricity for its customers, and it is in the process of implementing the statewide RPS to increase the proportion of renewable energy (e.g. solar and wind) within its energy portfolio. PG&E has achieved at least a 33% mix of renewable energy resources in 2020 and is on track to achieve 60% mix of renewable energy by 2030. Other statewide measures, including those intended to improve the energy efficiency of the statewide passenger and heavy-duty truck vehicle fleet (e.g. the Pavley Bill and the Low Carbon Fuel Standard), would improve vehicle fuel economies, thereby conserving gasoline and diesel fuel. These energy savings would continue to accrue over time.

The proposed Project would comply with all existing energy standards and would not be expected to result in significant adverse impacts on energy resources. For these reasons, the proposed Project would not cause an inefficient, wasteful, or unnecessary use of energy resources nor cause a significant impact on any of the thresholds as described by the *CEQA Guidelines*. This is a less than significant impact.

Under the No Project (No Build) Alternative, the proposed Project would not be constructed, and no construction or operational activities would occur. As such, this impact would be reduced when compared to the proposed Project.

Hazards and Hazardous Materials

Site Assessment: Based on the review of historical aerial photographs, a site reconnaissance and contacts with the local regulatory agencies, there is evidence that PAOCs exist in connection with the historical uses of the Development Area. During the course of the Phase I ESA, no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs) and historical RECs (HRECs) were identified in conjunction with the Development Area as defined by ASTM E 1527-13. However, the following potential areas of concern (PAOCs) presented and discussed in Section 3.8 Hazards. The Project site is not on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. Overall, proposed Project would have a less than significant impact with regards to this environmental issue.

Construction Phase: Further, construction workers and the general public could be exposed to hazards and hazardous materials as a result of improper handling or use during construction activities (particularly by untrained personnel); transportation accidents; or fires, or other emergencies. Construction workers could also be exposed to hazards associated with accidental releases of hazardous materials, which could result in significant impacts to the health and welfare of people and/or wildlife. Additionally, an accidental release into the environment could result in the contamination of water, habitat and countless resources. Compliance with existing regulatory requirements of the Regional Water Quality Control Board would require the preparation of a project specific Stormwater Pollution Prevention Plan (SWPPP). The SWPPP is required to include project specific best management measures that are designed to control erosion and the loss of topsoil to the extent practicable using best management practices (BMPs) that the RWQCB has deemed effective in controlling erosion, sedimentation and runoff during construction activities.

The proposed Project would also be required to comply with regulations on the transportation of hazardous materials codified in 49 CFR 173 and 49 CFR 177 and CCR Title 26, Division 6. These regulations, which are under the jurisdiction of Caltrans and the CHP, provide specific packaging requirements, define unacceptable hazardous materials shipments, and prescribe safe-transit practices by carriers of hazardous materials. Compliance with these regulations would reduce the risk of exposure to humans and the environment related to the transportation of hazardous materials.

Construction specifications would include the following requirements in compliance with applicable regulations and codes, including, but not limited to, CCR Titles 8 and 22, Uniform Fire Code, and Division 20 of the California Health and Safety Code: all reserve fuel supplies and hazardous materials must be stored within the confines of a designated construction area; equipment refueling and maintenance must take place only within the staging area; and construction vehicles shall be inspected daily for leaks. Off-site activities (e.g., utility construction) would also be required to comply with these regulations. These regulations and codes must be implemented, as appropriate, and are monitored by the State and/or local jurisdictions, including the FCEHS.

Contractors would be required to comply with Cal-EPA’s Unified Program; regulated activities would be managed by FCEHS, the designated Certified Unified Program Agency for Fresno County, in accordance with the regulations included in the Unified Program (e.g., hazardous materials release response plans and inventories, California UFC hazardous material management plans and inventories).

Overall, consistency with federal, State, and local laws and regulations related to the handling of hazardous materials discussed above and implementation of Mitigation Measures 3.8-1 and 3.8-2 would ensure that these potential impacts are reduced to a less than significant level.

Operational Phase: The operational phase of the proposed Project will occur after construction is completed and residents move in to occupy the structures on a day-to-day basis. The proposed Project includes the development of residential structures. Each of these uses will likely use a variety of hazardous materials commonly found in urban areas, including paints, cleaners and cleaning solvents. If handled appropriately, these materials do not pose a significant risk. These facilities will store and use these materials. There will be a risk of release of these materials into the environment if they are not stored and handled in accordance with best management practices approved by FCEHS and the Clovis Fire Department.

Airports: There are no documented public airports or public use airports within close proximity to the Project site.

Emergency Evacuation and Wildfire: In Fresno County, all major roads are available for evacuation, depending on the location and type of emergency that arises. The proposed Project does not include any actions that would impair or physically interfere with any of Fresno County's emergency plans or evacuation routes. Construction activities are not expected to result in any unknown significant road closures, traffic detours, or congestion that could hinder the emergency vehicle access or evacuation in the event of an emergency. Any construction project that could involve road closures, traffic detours and congestion, shall be required to obtain traffic control plans approved by the City as the lead agency.

The Project site is not categorized as a "Very High" FHSZ by CalFire. The Project site is not located within an LRA and is categorized as Urban Unzoned or Non-Wildland/Non-Urban. The Project site is located in an area that is predominately single-family residential uses, which do not pose a significant risk of wildfire.

Under the No Project (No Build) Alternative, no new land uses would be introduced to the Project site, and the potential for hazardous material release on the Project site would be eliminated. As such, this impact would be reduced when compared to the proposed Project.

Hydrology and Water Quality

Construction: In accordance with the NPDES Stormwater Program, the Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and the existing regulatory requirements. Further, the Project would be required to incorporate appropriate erosion and sediment control measures per Section 9.110.040 of the City's Municipal Code and adhere to the City's landscape standards designed to reduce runoff and control soil erosion. Compliance with the Construction General Permit and applicable City grading regulations would ensure that the proposed Project would have a less than significant impact relative to this topic.

Operational: The long-term operations of the proposed Project could result in long-term impacts to surface water quality from urban stormwater runoff. The proposed Project would result in new impervious areas associated with roadways, driveways, and residential structures. The Project site will include construction of a new storm drainage system, which will conform to applicable standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations, standards, and specifications. This includes, but not limited to, the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. BMPs will be implemented through the SWPPP program and compliance with existing standards and rules, including the implementation of BMPs, would ensure that the proposed Project would have a less than significant impact relative to this topic.

Infiltration/Natural Recharge: The proposed Project would result in new impervious surfaces and could reduce rainwater infiltration and groundwater recharge. The infiltration rate of the soils on the Project site ranges from low to high. This cementation inhibits infiltration of surface water into the soil stratum below the hardpan. Therefore, it can be presumed that the Project site generally does not allow for a high level of groundwater recharge in its existing condition. Development of the Project site with impervious surfaces is unlikely to reduce rainwater infiltration and groundwater recharge when compared to existing conditions. The open space areas of the development totaling approximately 5.54 acres will remain largely pervious. The collection of rainwater for those areas of impervious surfaces will be routed into the proposed Project's storm drainage system and eventually flow into the San Joaquin River.

Groundwater Extraction: Since the 2015 UWMP, SGMA has become effective, and the City is working collaboratively with other agencies reliant on the groundwater basin to reach sustainable management of the groundwater aquifer prior to 2040. The supply from groundwater sources has been modified to reflect this change in the City's supply portfolio. The projected groundwater supply in the 2020 UWMP shows it decreasing to the estimated sustainable amount of 9,400 AFY. (Provost & Pritchard, 2021B). The overall water supply is met with an increase in surface and recycled water sources to offset the reduced use of groundwater resources.

Groundwater supply projections include approved developments outside of the City boundaries, but within the planning area, and estimated groundwater pumping by others within the planning area. The projected groundwater supply reliability does not account for groundwater pumping outside the City planning area, nor undocumented privately owned domestic or irrigation wells. Groundwater use may increase as population increases, and groundwater use by others (including school districts and agricultural users) may also increase in single dry years and multiple dry years (when surface water cutbacks occur).

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The water supply for the City as a whole is shifting more toward surface water supplies since 2015 and will continue on that path through 2040 to ensure compliance with the Kings sub basin groundwater sustainability plan (GSP).

Stormwater Quality: Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Flooding: The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The Project site is subject to flood inundation as a result of dam failure. Regular inspection by DSD and maintenance by the dam owners ensure that the dams are kept in safe operating conditions. As such, failure of these dams is considered to have an extremely low probability of occurring and is not considered to be a reasonably foreseeable event.

The No Project (No Build) Alternative would result in no development on the Project site. As such, this alternative would have no impact on hydrology and water quality. As such, this impact would be reduced when compared to the proposed Project.

Land Use, Population, and Housing

The Project site is located directly north of the City of Clovis limit line and is adjacent primarily to undeveloped agricultural land, rural residential land, and low-density residential uses. The Project site would result in an extension of developed uses within an area of the City that currently has approved development plans within the vicinity of the Project site. The Project would provide roadways and pedestrian pathways to connect the Project site to the existing circulation system and to allow access to and from the site. Development of the Project site would not result in physical barriers, such as a highway, wall, or other division, that would divide an existing community, but would serve as an orderly extension of existing and planned developments. The proposed Project would have no impact with regard to the physical division of an established community. The proposed Project would not displace substantial numbers of people or existing housing.

The proposed Project would not conflict with the General Plan. The pre-zoning would go into effect upon annexation into the City of Clovis. The proposed zone change would ensure that zoning will be consistent with the proposed General Plan designation within the Development Area. The City will review each component of the proposed Project as plans (improvement plans, building plans, site plans, etc.) are submitted for final approval to ensure that they are consistent with the City's Zoning ordinance. Approval of the pre-zoning will ensure that the proposed Project will be consistent with the Zoning Code. The proposed Project is consistent with LAFCo policies adopted to address environmental impacts.

The proposed infrastructure improvements would be adequately sized to serve the proposed Project only. The proposed infrastructure would not be oversized to accommodate any growth beyond the Project site into areas that were not previously served. While the proposed Project will result in growth, it is not anticipated to significantly induce growth. Implementation of the proposed Project will have a less than significant impact relative to this topic.

Under the No Project (No Build) Alternative, no new land uses would be introduced to the Project site and the potential for land use conflicts would be eliminated. As such, this impact would be reduced when compared to the proposed Project.

Noise

When comparing existing plus project levels to existing levels, Sunnyside Avenue from Project Intersection 1 to Shepherd Avenue has the potential for significant impact as the only roadway segment with an increase of more than 3 dB. The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses, but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls. These walls must be at least 4.2 lbs/ft^2. Any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows, which would not be shielded by the 6- foot sound walls.

The proposed Project would include typical residential noise sources which would be compatible with the adjacent existing residential uses (a.k.a. neighborhood traffic, yard equipment, truck deliveries, garbage collected, etc.). Proposed neighborhood parks are located internal to the Project site and would not impact off-site residential uses.

Based upon a 25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to be approximately 44 dB L_{dn}. Therefore, this is a less than significant impact.

During the construction of the Project, including roads, water, sewer lines, and related infrastructure, noise from construction activities would add to the noise environment in the Project vicinity. Construction noise is considered a short-term impact and would be considered significant if construction activities are taken outside the allowable times as described in the City of Clovis Municipal Code Section 5.27.604. Construction is anticipated to occur during the permissible hours according to the City's Municipal Code. Construction noise will have a temporary or periodic increase in the ambient noise level above the existing within the Project vicinity. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Noise levels will be the loudest during the grading phase. The modeling assumes construction equipment as close as 25 feet from the adjacent residences and an average of 550 feet away from the adjacent residences. Unmitigated noise levels at 550 feet have the potential to reach 60 dBA Leq and 92 dBA Lmax at the nearest sensitive receptors during grading. Noise levels for the other construction phases would be lower, approximately from 46 to 59 dBA Leq and 86 to 93 dBA Lmax. This would be a 13 dB Leq daytime increase in the ambient noise level at the residents along Perrin Rd., Purdue Ave., and East Lexington Ave.

Furthermore, noise reduction policies within the General Plan and standards within the Municipal Code are provided to further reduce construction noise.

The construction of the proposed Project would not require the use of equipment such as pile drivers, which are known to generate substantial construction vibration levels. The primary vibration source during construction may be from a bulldozer or other earthmoving/grading equipment, which is calculated to be below the vibration impact threshold.

The Project site is outside the Fresno Yosemite International Airport noise contours and there are no private airstrips, public airports, or public use airports within two miles of the Project site.

The No Project (No Build) Alternative would result in no development on the Project site. As such, this alternative would have no impact from noise. As such, this impact would be reduced when compared to the proposed Project.

Public Services and Recreation

The proposed Project will create an increased demand for public services such as police protection, fire services, school services, and recreation compared to existing conditions. To the extent that the Project would have an incremental increase in demand on public services, the Project would be required to pay the impact fees to assure that the current level of service goals of the City are met. Impact fees from new development are collected based upon projected impacts from each development. The adequacy of impact fees is reviewed periodically to ensure that the fee is commensurate with the service. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund capital and labor costs associated with police services.

The Project does not propose and would not create a need for new or physically altered public service facilities to maintain acceptable service ratios, response times, or other performance objectives. Therefore, the Project would not result in adverse physical impacts associated with such facilities.

The Project proposes to include open space totaling approximately 5.54 acres on-site, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, which would not provide the park land needed to meet the four acres per 1,000 people. However, Municipal Code Chapter 3.4, Park Acquisition and Development, states that any developer who plans for dwelling units to be constructed in the City shall pay, in addition to any other fees required to be paid by the City, a fee which shall be calculated on the basis of park acreage designated in the Clovis General Plan consisting of the estimated total land acquisition and construction cost distributed on the basis of the remaining developable area within the sphere of influence. In accordance with the Municipal Code, fees are deposited in specific funds that shall be used solely for the acquisition, improvement and expansion of public parks and recreation facilities as outlined in the park acquisition and improvement fee update. Thus, upon provision and dedication of the proposed parkland and/or payment of required fees in accordance with the Clovis Municipal Code Chapter 3.04, and other Municipal Code policies, the proposed Project will result in a less than significant impact.

As stated previously, the proposed Project will directly increase the number of persons in the area through the addition of 605 new residential units. The Project also provides open space on-site, totaling 5.54 acres, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, and will pay park impact fees according to Municipal Code Chapters 3.04 and 3.10. It is not anticipated that the proposed Project would result in a significant increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial deterioration would occur because the Project includes new recreational facilities for residents within the Project site, and provides funding to existing park facilities through required fees.

The proposed Project would not significantly increase the use of an existing park, or other recreational facility. Therefore, it is not anticipated that any substantial physical deterioration of existing facilities would occur or be accelerated. As such, the proposed Project would have a less than significant impact relative to this topic.

The No Project (No Build) Alternative would result in no development on the Project site. As such, this alternative would have no impact on public services. As such, this impact would be reduced when compared to the proposed Project.

Transportation and Circulation

The Project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Therefore, based on the TIA Guidelines, the project will have a significant VMT impact. Project design features aim to promote overall mobility with the goal of reducing VMT and reducing greenhouse gas emissions. Implementation of these Project design features may possibly reduce the Project's VMT by approximately up to 1.18 percent. The Project design features can help offset some of the VMT impacts of the Project, but will not reduce the impact to a less than significant level. Therefore, the Project will have a significant and unavoidable relative to this topic.

Results of the LOS analysis shows that all intersections and roadway segments are forecast to operate at a satisfactory LOS under Near-Term (2028) Plus Project conditions with the exception of 10 intersections and 3 roadway segments; And all intersections and roadway segments are forecast to operate at a satisfactory LOS under Cumulative (2046) Plus Project Conditions with the exception of 15 intersections and 10 roadway segments.

Improvements have been recommended at study intersections and roadway segments where an operational deficiency has been identified based on the results of the LOS analysis. It should be noted the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, both the ramp intersections are projected to have queuing deficiencies under future conditions (near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. The intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under near-term, and cumulative scenarios with implementation of this improvement. Further, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Recommended improvements for roadway segments for all analysis scenarios. It should be noted that the segment of Fowler Avenue, between Ticonderoga and Shepherd Avenue is forecast to operate at a deficient LOS under Cumulative (2046) without and plus project conditions. However, this segment is designated as a Rural collector (2-lanes) in the City’s General Plan Circulation Element, and already constructed as per the General Plan Circulation Element designation. Additionally, the Project is not estimated to add any traffic at this segment during either peak hours. Therefore, no improvement has been recommended for this roadway segment.

With recommended improvements, all intersections would operate at LOS D or better with the addition of Project trips. Furthermore, in the absence of a fee program where the Project has an impact on the roadway network, the Project will pay its respective fair share for the proposed improvements. Therefore, implementation of the proposed Project would not result in a conflict with an existing or planned pedestrian facility, bicycle facility, or transit service/facility. Because the proposed Project would not conflict with adopted programs, plans, policies, or ordinances that address the circulation system, including transit, bicycle, and pedestrian facilities; this impact is considered less than significant.

The preliminary site plan indicates adequate emergency access would be provided and there do not appear to be any geometric hazards. Furthermore, a sight distance analysis was conducted at the Project driveways. Based on the sight distance analysis, the proposed Project driveways achieve adequate sight distances and have clear sight triangles for drivers.

With consideration to pedestrian safety to nearby schools, a signal should be installed at the project access intersection under the with marked crosswalks and other safety improvements. As such, a safe walking route to the elementary school would be present for elementary school students from the Project.

All Project access intersections, internal intersections, and internal roadways are anticipated to be carefully designed to ensure they can accommodate emergency vehicles, subject to approval of the City of Clovis. All intersections and street sections would be reviewed by the City of Clovis and designed to comply with typical City standards.

Additionally, the proposed Project would not conflict with any program, plan, ordinance, or policy addressing the circulation system, substantially increase hazards due to a geometric feature, or result in inadequate emergency access. Therefore, implementation of the proposed Project would be less than significant relative to this topic.

The No Project (No Build) Alternative would result in no development on the Project site. As such, this alternative would have no impact on traffic. As such, this impact would be reduced when compared to the proposed Project.

Utilities

The installation of the wastewater collection and conveyance system, water supply systems, and stormwater infrastructure to serve the proposed Project would have a less than significant impact relative to this topic.

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The proposed Project would not result in insufficient water supplies available to serve the Project from existing entitlements and resources. Therefore, the proposed Project would result in a less than significant impact to water supplies.

The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The proposed stormwater collection system functions through storm drainage collection, treatment, and discharge. The exact sizing of the underground piping will be engineered during the preparation of the improvement plans, which will be in coordination with FMFCD. The proposed storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB) and City of Clovis regulations; Phase II, National Pollutant Discharge Elimination System (NPDES) Permit Requirements; NPDES-MS4 Permit Requirements; and LID Guidelines.

Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Per CalRecycle generation rate estimates, the Development Area is estimated to generate roughly 12 pounds per household per day[3]. It is estimated that the proposed 605 residential units would generate approximately 7,400 pounds per day of solid waste. The total solid waste generated by the proposed Project is estimated to be 3.4 tons per day. This equates to roughly 0.17 percent of the total allowable daily maximum disposal at the Clovis Landfill and would not cause an exceedance of the landfill's remaining capacity. Therefore, the City's projected increase in solid waste generation associated with future buildout of the proposed Project is expected to be within the permitted capacities of landfills utilized by the City. Based on the estimated closure dates of the Clovis Landfill in 2047 and the American Avenue Landfill in 2031, development under the proposed Project would not result in a significant impact on landfill capacity. This is a less than significant impact.

Electrical services are provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along Shepherd Avenue and from existing residential development surrounding the Project site. PG&E and AT&T operate and maintain transmission and distribution infrastructure in the Project area. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Although the proposed Project would increase demand for electricity, and telecommunications facilities, utility improvements would be installed in conjunction with planned street improvements. Although the Project would require construction of new electrical facilities within the site, these improvements would be limited to connections to existing facilities near the Project site. The proposed Project would not result in the relocation or construction of new or expanded electrical, and telecommunications facilities, the construction or relocation of which could cause significant environmental effects. This is a less than significant impact.

---

[3] Note: data based on CalRecycle estimated solid waste generation rates for single family residential uses.; 12.23 lbs./household/day. (CalRecycle, 2022A).

The No Project (No Build) Alternative would result in no development on the Project site. As such, this alternative would have no impact on utilities. As such, this impact would be reduced when compared to the proposed Project.

INCREASED DENSITY MIXED USE ALTERNATIVE

Aesthetics and Visual Resources

As described in Section 3.1, the visual character of the Project site would be altered as a result of Project implementation. Implementation of the City's design standards would ensure quality and cohesive design of the Project site. These standards include specifications for building height, massing, and orientation, exterior lighting standards, and landscaping standards. Following the City's design requirements will produce a project that will be internally cohesive, while maintaining and aesthetic feel similar to that of the surrounding uses. The Clovis General Plan EIR concluded that adoption of the General plan which contemplated urbanization of the lands within the General Plan study area, was a less than significant environmental impact.

There are no designated State Scenic Highways in the vicinity of the Project site. No officially designated State scenic highways are located in the City of Clovis. The nearest eligible State scenic highway to the City is State Route 168, which is located in Fresno County northeast of the City of Clovis. The City of Clovis and the Project site are not visible from this roadway segment. Additionally, there are no "eligible" highway segments in the Project vicinity that may be included in the State Scenic Highway system.

The proposed Project would be required to implement existing City regulations aimed at reducing light and glare impacts to ensure that no unusual daytime glare or nighttime lighting is produced. Specifically, the Clovis Development Code states that direct glare shall not be permitted and provides standards for nuisance prevention and shielding requirements. Section 9.22.050 of the Clovis Development Code contains standards and provisions related to exterior lighting. Implementation of regulations and standards within the Clovis Development Code would reduce impacts associated with increased light and glare to a less than significant level.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This alternative would result in a different density and mix of land uses, but overall, it would not substantially impact the visual character or quality of the Project site or its surroundings, damage scenic resources within a State Scenic Highway, or potentially significant new sources of light and glare. As such, this impact would be largely equal when compared to the proposed Project.

Agricultural Resources

Currently, the majority of the Project site is vacant agricultural land. Development of the proposed Project would result in the permanent conversion of approximately 63.60 acres of Prime Farmland and 11.44 acres of Farmland of Statewide Importance, as designated by the California Department of Conservation on the June 2020 Important Farmlands Map to nonagricultural use. The California Land Evaluation and Site Assessment (LESA) Model was utilized to determine the proposed

Project's potential impact on agricultural resources. The LESA scoring for the proposed Project shows that the conversion of the land on the Project site is not considered significant according to the California Department of Conservation' established thresholds.

The Project site is not under a Williamson Act Contract, and the proposed pre-zoning is consistent with the urban uses anticipated by the City under the adopted General Plan. There is no immediately adjacent agricultural land that poses a potential for conflict. Development of the proposed Project was found to have a less than significant impact relative to this topic.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This alternative would result in the same land conversion as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Air Quality

To achieve attainment with the standards, the SJVAPCD has established thresholds of significance for criteria pollutant emissions. Projects with emissions below the thresholds of significance for criteria pollutants would be determined to "Not conflict or obstruct implementation of the District's air quality plan."

CalEEMod^{TM} (v.2020.4.0) was used to model operational emissions of the proposed Project. The SJVAPCD has established their thresholds of significance by which the Project emissions are compared against to determine the level of significance. If the proposed Project's emissions will exceed the SJVAPCD's threshold of significance for operational-generated emissions, the proposed Project will have a significant impact on air quality and all feasible mitigation are required to be implemented to reduce emissions to the extent feasible. It was found that operational emissions would not exceed any of the SJVACPD operational thresholds of significance.

The proposed Project would comply with pre-existing requisite federal, State, SJVAPCD, and other local regulations and requirements, as well as implement the control measures provided by the SJVAPCD for construction-related PM_{10} emissions. Compliance with the existing rules and regulations would ensure that the Project's criteria pollutant emissions would be considered to have a less than significant impact.

Substantial concentrations of carbon monoxide are not expected at or along any streets or intersections affected by the development of the Project site. Residences would not be located within 500 feet of a freeway or high-traffic road, or be within any of the other CARB minimum separation recommendations on siting sensitive land uses. Regardless, the proposed Project would not have land uses that would generate a significant risk of public exposure to TACs.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different emissions generated compared to the proposed Project. Emissions would be slightly greater. This impact would be slightly greater when compared to the proposed Project.

Biological Resources

The biological analysis showed that there were no special-status invertebrates, or their habitat, observed within the Project site during field surveys and none are expected to be affected by the proposed Project. The Project site also does not contain suitable aquatic or upland habitat for special status reptiles or amphibians known to occur in the region. It was determined during the field survey the that the agricultural disturbance on the project site precludes the existence of special-status plants unless agricultural operations were to cease. The Project site does not contain protected wetlands or other jurisdictional areas and there is no need for permitting associated with the Federal or State Clean Water Acts. There are no sensitive natural communities within the Project site. The land uses within the Project site would not have any direct disturbance to the San Joaquin River or its tributaries, and therefore, would not have any direct disturbance to the movement corridor or habitat. The proposed Project is not subject to a Habitat Conservation Plan. The proposed Project requires the removal of the pecan orchard within the Development Area. Pecan trees are fruit trees and are, thus, exempt from the tree removal and replacement requirements.

The Project would result in the removal of an orchard, which is not high-quality nesting or foraging habitat for special-status birds. Powerlines and trees located in the region represent potentially suitable nesting habitat for a variety of special-status birds. Additionally, the agricultural land with low growing crops or grasslands represents potentially suitable nesting habitat for the ground-nesting birds. In general, most nesting occurs from late February and early March through late July and early August, depending on various environmental conditions. The CNDDB does not provide any records of special status birds on the Project site, or in the immediate vicinity. Nevertheless, birds are highly mobile and can be expected to fly over the Project site at times. They could use the site for foraging, although it is not high-quality habitat for foraging. The Project site does not contain high quality nesting habitat for special status birds given that it is an orchard.

New sources of noise and light during the construction and operational phases of the project could adversely affect nesters if they located adjacent to the Project site in any given year. Additionally, the proposed Project would eliminate the open undeveloped land on the Project site, which could serve as limited foraging habitat for birds throughout the year. Mitigation Measure 3.4-1 requires preconstruction surveys for active nests of special-status birds and buffers around nests should they be identified during the surveys. Development of the proposed Project, with the Mitigation Measure 3.4-1, would ensure that potential impacts to special-status birds are reduced to a less than significant level.

Development of the Project site would eliminate foraging habitat for special-status bats by removing the agricultural areas. These special-status bat species, or evidence of bat presence (i.e. guano), were not observed during the field surveys and have not been documented on the Project site; therefore, they are not expected to be directly affected. Implementation of Mitigation Measure 3.4-2 requires surveys for active maternity roosts if removal of suitable roosting areas (i.e., buildings, trees, shrubs, bridges, etc.) must occur during the bat pupping season (April 1 through July 31). If a special-status bat maternity roost is located, appropriate buffers around the roost sites would be required. Therefore, development of the proposed Project with Mitigation Measure 3.4.2, would ensure that potential impacts to special status bat species are reduced to a less than significant impact.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This alternative would result in the same habitat conversion as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Cultural and Tribal Resources

The Project site encompasses approximately 77-acre for physical development, and 78 acres for non-development entitlements. The Project site is not located in an area known to have historical and archaeological resources, however, as with most projects in the region that involve ground-disturbing activities, there is the potential for discovery of a previously unknown historical and archaeological resources. Implementation Mitigation Measure 3.5-1 would ensure that this impact is less than significant. Additionally, while no human remains were found during field surveys of the Project site, implementation of the Mitigation Measure 3.5-1 would ensure that all construction activities which inadvertently discover human remains implement state-required consultation methods to determine the disposition and historical significance of any discovered human remains. Implementation of Mitigation Measure 3.4-1 would ensure that the potential impact to disturb human remains, including those interred outside of formal cemeteries to a less than significant level.

The City of Clovis sent outreach letters to the twelve tribal representatives listed in the NAHC response. While no specific resources have been identified through consultation with affiliated tribes, it is possible that unknown tribal cultural resources may be present within the Development Area. The Proposed Project would be required to follow development requirements, including compliance with local policies, ordinances, and applicable permitting procedures related to protection of tribal resources. Implementation of Mitigation Measure 3.5-1 would ensure that the potential impact to tribal resources*, including human remains, would be* less than significant.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This alternative would result in the same potential to disturb or destroy cultural, historic, archaeological, and tribal resources as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Geology and Soils

The Project site is subject to potential ground shaking caused by seismic activity. All construction will be designed in accordance with the latest seismic design standards of the California Building Code. These design standards and requirements are intended to minimize impacts to structures in seismically active areas of California. The Project site has a low risk of seismic-related ground failure as a result of liquefication. Landslide potential on the Project site is also low to non-existent. The Project site does not have a significant risk of becoming unstable as a result landslide, subsidence, soil collapse, liquefaction, liquefaction induced settlement, or lateral spreading. The soils on the Project site have a low shrink-swell potential. A final soils report will be performed at a design-level to ensure that the foundations, structures, roadway sections, sidewalks, and other improvements can accommodate the specific soils, including expansive soils, at those locations.

Septic tanks or septic systems are not proposed as part of the Development Area and will not be installed to serve the Development area. The residences within the Non-development Area are currently on septic systems. There are no new residences proposed in this area, and no new septic systems would be installed. This area would be part of the SOI expansion, but would not be part of the annexation. At some future date, if those residents decided to annex into the City, they would be required to connect to the City of Clovis wastewater collection and treatment system and destroy the existing septic systems.

The Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and are existing regulatory requirements.

The Project site is not expected to contain subsurface paleontological resources, it is possible that undiscovered paleontological resources could be encountered during ground-disturbing activities. Implementation of Mitigation Measure 3.6-1 would ensure steps would be taken to reduce impacts to paleontological resources in the event that they are discovered during construction, including stopping work in the event potential resources are found, evaluation of the resource by a qualified paleontologist and appropriate handling of any potential resource. This mitigation measure would reduce this impact to a less than significant level.

There are no past or current commercial mining operations within the Project site. Development of the proposed Project would have a less than significant impact relative to this topic.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This alternative would result in the same potential for geologic hazards as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Greenhouse Gases, Climate Change and Energy

Estimated maximum mitigated GHG emissions associated with construction of the proposed Project are estimated at a maximum of approximately 776.8 MT CO_2e per year. The annual mitigated GHG emissions associated with operations of the proposed Project would be approximately 5,071 MT CO_2e.

The proposed Project is estimated to generate approximately 2,097 residents during the Project's operational phase.[4] Dividing this number of estimated residents generated by the Project by the total annual operational GHG emissions at Project buildout yields approximately 2.42 MT CO_2e/SP/Year, which is below the 2.62 MT CO_2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Construction emissions, when amortized[5], would equal approximately emissions 25.9 MT CO_2e, which is equivalent to approximately 0.01 MT CO_2e/SP/Year. Therefore, the total annual GHG emissions at Project buildout would still yield approximately 2.43 MT CO_2e/SP/Year, after inclusion of the amortized construction emissions.

GHG emissions associated the proposed Project are below the derived GHG threshold; therefore, the proposed Project would not affect statewide GHG reduction goals. The proposed Project would generate GHG emissions, directly and indirectly, that would not exceed the 2.62 MT CO2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Therefore, the proposed Project's greenhouse gas emissions would be considered to have a less than significant impact relative to this topic.

Electricity used by the proposed Project would be used primarily to generate energy for the residential homes, landscape lighting, and street lighting. As shown in the following tables, "Energy" is one of the categories that was modeled for GHG emissions. The total unmitigated and mitigated GHG emissions generated from the "Energy" category during Project operation is 1,231 CO_2e.

The proposed Project would generate operational vehicle trips that would use a total of approximately 2,100 gallons of gasoline and 341 gallons of diesel per day, or 341,321 gallons of gasoline and 69,484 gallons of diesel per year.

The proposed Project would use a total of approximately 18,955 gallons of diesel fuel for off-road construction vehicles.

The proposed Project would use energy resources for the operation of Project buildings (electricity), outdoor lighting (electricity), for on-road vehicle trips (e.g. gasoline and diesel fuel) rerouted by the proposed Project, and from off-road and on-road construction activities associated with the proposed Project (e.g. diesel fuel). Each of these activities would require the use of energy resources. The proposed Project would be responsible for conserving energy, to the extent feasible, and relies heavily on reducing per capita energy consumption to achieve this goal, including through statewide and local measures.

The proposed Project would be in compliance with all applicable federal, State, and local regulations regulating energy usage. For example, PG&E, the electric and natural gas provider to the proposed Project, is responsible for the mix of energy resources used to provide electricity for

---

[4] This estimate is based on the estimate provided by LSA in their Transportation Impact Analysis (LSA, 2023).

[5] The amortization period used for this calculation is 30 years.

its customers, and it is in the process of implementing the statewide RPS to increase the proportion of renewable energy (e.g. solar and wind) within its energy portfolio. PG&E has achieved at least a 33% mix of renewable energy resources in 2020 and is on track to achieve 60% mix of renewable energy by 2030. Other statewide measures, including those intended to improve the energy efficiency of the statewide passenger and heavy-duty truck vehicle fleet (e.g. the Pavley Bill and the Low Carbon Fuel Standard), would improve vehicle fuel economies, thereby conserving gasoline and diesel fuel. These energy savings would continue to accrue over time.

The proposed Project would comply with all existing energy standards and would not be expected to result in significant adverse impacts on energy resources. For these reasons, the proposed Project would not cause an inefficient, wasteful, or unnecessary use of energy resources nor cause a significant impact on any of the thresholds as described by the *CEQA Guidelines*. This is a less than significant impact.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This increased density would result in greater operational emissions, and slightly more construction emissions when compared to the proposed Project.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different emissions generated compared to the proposed Project. Emissions would be slightly greater. This impact would be slightly greater when compared to the proposed Project.

Hazards and Hazardous Materials

Site Assessment: Based on the review of historical aerial photographs, a site reconnaissance, and contacts with the local regulatory agencies, there is evidence that PAOCs exist in connection with the historical uses of the Development Area. During the course of the Phase I ESA, no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs) and historical RECs (HRECs) were identified in conjunction with the Development Area as defined by ASTM E 1527-13. However, the following potential areas of concern (PAOCs) presented and discussed in Section 3.8 Hazards. The Project site is not on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. Overall, proposed Project would have a less than significant impact with regards to this environmental issue.

Construction Phase: Further, construction workers and the general public could be exposed to hazards and hazardous materials as a result of improper handling or use during construction activities (particularly by untrained personnel); transportation accidents; or fires, or other emergencies. Construction workers could also be exposed to hazards associated with accidental releases of hazardous materials, which could result in significant impacts to the health and welfare of people and/or wildlife. Additionally, an accidental release into the environment could result in the contamination of water, habitat and countless resources. Compliance with existing regulatory requirements of the Regional Water Quality Control Board would require the preparation of a project specific Stormwater Pollution Prevention Plan (SWPPP). The SWPPP is required to include project specific best management measures that are designed to control erosion and the loss of topsoil to the extent practicable using best management practices (BMPs) that the RWQCB has deemed effective in controlling erosion, sedimentation and runoff during construction activities.

The proposed Project would also be required to comply with regulations on the transportation of hazardous materials codified in 49 CFR 173 and 49 CFR 177 and CCR Title 26, Division 6. These regulations, which are under the jurisdiction of Caltrans and the CHP, provide specific packaging requirements, define unacceptable hazardous materials shipments, and prescribe safe-transit practices by carriers of hazardous materials. Compliance with these regulations would reduce the risk of exposure to humans and the environment related to the transportation of hazardous materials.

Construction specifications would include the following requirements in compliance with applicable regulations and codes, including, but not limited to, CCR Titles 8 and 22, Uniform Fire Code, and Division 20 of the California Health and Safety Code: all reserve fuel supplies and hazardous materials must be stored within the confines of a designated construction area; equipment refueling and maintenance must take place only within the staging area; and construction vehicles shall be inspected daily for leaks. Off-site activities (e.g., utility construction) would also be required to comply with these regulations. These regulations and codes must be implemented, as appropriate, and are monitored by the State and/or local jurisdictions, including the FCEHS.

Contractors would be required to comply with Cal-EPA's Unified Program; regulated activities would be managed by FCEHS, the designated Certified Unified Program Agency for Fresno County, in accordance with the regulations included in the Unified Program (e.g., hazardous materials release response plans and inventories, California UFC hazardous material management plans and inventories).

Overall, consistency with federal, State, and local laws and regulations related to the handling of hazardous materials discussed above and implementation of Mitigation Measures 3.8-1 and 3.8-2 would ensure that these potential impacts are reduced to a less than significant level.

Operational Phase: The operational phase of the proposed Project will occur after construction is completed and residents move in to occupy the structures on a day-to-day basis. The proposed Project includes the development of residential structures. Each of these uses will likely use a variety of hazardous materials commonly found in urban areas, including paints, cleaners and cleaning solvents. If handled appropriately, these materials do not pose a significant risk. These facilities will store and use these materials. There will be a risk of release of these materials into the environment if they are not stored and handled in accordance with best management practices approved by FCEHS and the Clovis Fire Department.

Airports: There are no documented public airports or public use airports within close proximity to the Project site.

Emergency Evacuation and Wildfire: In Fresno County, all major roads are available for evacuation, depending on the location and type of emergency that arises. The proposed Project does not include any actions that would impair or physically interfere with any of Fresno County's emergency plans or evacuation routes. Construction activities are not expected to result in any unknown significant road closures, traffic detours, or congestion that could hinder the emergency vehicle access or evacuation in the event of an emergency. Any construction project that could involve road closures, traffic detours and congestion, shall be required to obtain traffic control plans approved by the City as the lead agency.

The Project site is not categorized as a "Very High" FHSZ by CalFire. The Project site is not located within an LRA and is categorized as Urban Unzoned or Non-Wildland/Non-Urban. The Project site is located in an area that is predominately single-family residential uses, which do not pose a significant risk of wildfire.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This alternative would result in the same potential for hazards as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Hydrology and Water Quality

Construction: In accordance with the NPDES Stormwater Program, the Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and the existing regulatory requirements. Further, the Project would be required to incorporate appropriate erosion and sediment control measures per Section 9.110.040 of the City's Municipal Code and adhere to the City's landscape standards designed to reduce runoff and control soil erosion. Compliance with the Construction General Permit and applicable City grading regulations would ensure that the proposed Project would have a less than significant impact relative to this topic.

Operational: The long-term operations of the proposed Project could result in long-term impacts to surface water quality from urban stormwater runoff. The proposed Project would result in new impervious areas associated with roadways, driveways and residential structures. The Project site will include construction of a new storm drainage system, which will conform to applicable standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations, standards, and specifications. This includes, but not limited to, the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. BMPs will be implemented through the SWPPP program, and compliance with existing standards and rules, including the implementation of BMPs, would ensure that the proposed Project would have a less than significant impact relative to this topic.

Infiltration/Natural Recharge: The proposed Project would result in new impervious surfaces and could reduce rainwater infiltration and groundwater recharge. The infiltration rate of the soils on the Project site ranges from low to high. This cementation inhibits infiltration of surface water into the soil stratum below the hardpan. Therefore, it can be presumed that the Project site generally does not allow for a high level of groundwater recharge in its existing condition. Development of the Project site with impervious surfaces is unlikely to reduce rainwater infiltration and groundwater recharge when compared to existing conditions. The open space areas of the development totaling approximately 5.54 acres will remain largely pervious. The collection of rainwater for those areas of impervious surfaces will be routed into the proposed Project's storm drainage system and eventually flow into the San Joaquin River.

Groundwater Extraction: Since the 2015 UWMP, SGMA has become effective, and the City is working collaboratively with other agencies reliant on the groundwater basin to reach sustainable management of the groundwater aquifer prior to 2040. The supply from groundwater sources has been modified to reflect this change in the City's supply portfolio. The projected groundwater supply in the 2020 UWMP shows it decreasing to the estimated sustainable amount of 9,400 AFY. (Provost & Pritchard, 2021B). The overall water supply is met with an increase in surface and recycled water sources to offset the reduced use of groundwater resources.

Groundwater supply projections include approved developments outside of the City boundaries, but within the planning area, and estimated groundwater pumping by others within the planning area. The projected groundwater supply reliability does not account for groundwater pumping outside the City planning area, nor undocumented privately owned domestic or irrigation wells. Groundwater use may increase as population increases, and groundwater use by others (including school districts and agricultural users) may also increase in single dry years and multiple dry years (when surface water cutbacks occur).

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The water supply for the City as a whole is shifting more toward surface water supplies since 2015 and will continue on that path through 2040 to ensure compliance with the Kings sub basin groundwater sustainability plan (GSP).

Stormwater Quality: Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Flooding: The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The Project site is subject to flood inundation as a result of dam failure. Regular inspection by DSD and maintenance by the dam owners ensure that the dams are kept in safe operating conditions. As such, failure of these dams is considered to have an extremely low probability of occurring and is not considered to be a reasonably foreseeable event.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This alternative would result in the same potential for impacts to hydrology and water quality as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Land Use, Population, and Housing

The Project site is located directly north of the City of Clovis limit line and is adjacent primarily to undeveloped agricultural land, rural residential land, and low-density residential uses. The Project site would result in an extension of developed uses within an area of the City that currently has approved development plans within the vicinity of the Project site. The Project would provide roadways and pedestrian pathways to connect the Project site to the existing circulation system and to allow access to and from the site. Development of the Project site would not result in physical barriers, such as a highway, wall, or other division, that would divide an existing community, but would serve as an orderly extension of existing and planned developments. The proposed Project would have no impact with regard to the physical division of an established community. The proposed Project would not displace substantial numbers of people or existing housing.

The proposed Project would not conflict with the General Plan. The pre-zoning would go into effect upon annexation into the City of Clovis. The proposed zone change would ensure that zoning will be consistent with the proposed General Plan designation within the Development Area. The City will review each component of the proposed Project as plans (improvement plans, building plans, site plans, etc.) are submitted for final approval to ensure that they are consistent with the City's Zoning ordinance. Approval of the pre-zoning will ensure that the proposed Project will be consistent with the Zoning Code. The proposed Project is consistent with LAFCo policies adopted to address environmental impacts.

The proposed infrastructure improvements would be adequately sized to serve the proposed Project only. The proposed infrastructure would not be oversized to accommodate any growth beyond the Project site into areas that were not previously served. While the proposed Project will result in growth, it is not anticipated to significantly induce growth. Implementation of the proposed Project will have a less than significant impact relative to this topic.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would not result in a conflict with land use, zoning, or policies. The increased density of residential uses, however, would be less compatible with the neighbors to the north compared to the proposed Project. As such, this impact would be greater when compared to the proposed Project.

Noise

When comparing existing plus project levels to existing levels, Sunnyside Avenue from Project Intersection 1 to Shepherd Avenue has the potential for significant impact as the only roadway segment with an increase of more than 3 dB. The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses, but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls. These walls must be at least 4.2 lbs/ft^2. Any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6- foot sound walls.

The proposed Project would include typical residential noise sources which would be compatible with the adjacent existing residential uses (a.k.a. neighborhood traffic, yard equipment, truck deliveries, garbage collected, etc.). Proposed neighborhood parks are located internal to the Project site and would not impact off-site residential uses.

Based upon a 25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to be approximately 44 dB L_{dn}. Therefore, this is a less than significant impact.

During the construction of the Project, including roads, water, sewer lines, and related infrastructure, noise from construction activities would add to the noise environment in the Project vicinity. Construction noise is considered a short-term impact and would be considered significant if construction activities are taken outside the allowable times as described in the City of Clovis Municipal Code Section 5.27.604. Construction is anticipated to occur during the permissible hours according to the City's Municipal Code. Construction noise will have a temporary or periodic increase in the ambient noise level above the existing within the Project vicinity. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Noise levels will be the loudest during the grading phase. The modeling assumes construction equipment as close as 25 feet from the adjacent residences and an average of 550 feet away from the adjacent residences. Unmitigated noise levels at 550 feet have the potential to reach 60 dBA Leq and 92 dBA Lmax at the nearest sensitive receptors during grading. Noise levels for the other construction phases would be lower, approximately from 46 to 59 dBA Leq and 86 to 93 dBA Lmax. This would be a 13 dB Leq daytime increase in the ambient noise level at the residents along Perrin Rd., Purdue Ave., and East Lexington Ave.

Furthermore, noise reduction policies within the General Plan and standards within the Municipal Code are provided to further reduce construction noise.

The construction of the proposed Project would not require the use of equipment such as pile drivers, which are known to generate substantial construction vibration levels. The primary vibration source during construction may be from a bulldozer or other earthmoving/grading equipment, which is calculated to be below the vibration impact threshold.

The Project site is outside the Fresno Yosemite International Airport noise contours and there are no private airstrips, public airports, or public use airports within two miles of the Project site.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different travel and use characteristics compared to the proposed Project. Noise generated by traffic would be slightly greater. Construction noise would largely be the same. As such, this impact would be slightly greater when compared to the proposed Project.

Public Services and Recreation

The proposed Project will create an increased demand for public services such as police protection, fire services, school services, and recreation compared to existing conditions. To the extent that the Project would have an incremental increase in demand on public services, the Project would be required to pay the impact fees to assure that the current level of service goals of the City are met. Impact fees from new development are collected based upon projected impacts from each development. The adequacy of impact fees is reviewed periodically to ensure that the fee is commensurate with the service. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund capital and labor costs associated with police services.

The Project does not propose and would not create a need for new or physically altered public service facilities to maintain acceptable service ratios, response times, or other performance objectives. Therefore, the Project would not result in adverse physical impacts associated with such facilities.

The Project proposes to include open space totaling approximately 5.54 acres on-site, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, which would not provide the park land needed to meet the four acres per 1,000 people. However, Municipal Code Chapter 3.4, Park Acquisition and Development, states that any developer who plans for dwelling units to be constructed in the City shall pay, in addition to any other fees required to be paid by the City, a fee which shall be calculated on the basis of park acreage designated in the Clovis General Plan consisting of the estimated total land acquisition and construction cost distributed on the basis of the remaining developable area within the sphere of influence. In accordance with the Municipal Code, fees are deposited in specific funds that shall be used solely for the acquisition, improvement and expansion of public parks and recreation facilities as outlined in the park acquisition and improvement fee update. Thus, upon provision and dedication of the proposed parkland and/or payment of required fees in accordance with the Clovis Municipal Code Chapter 3.04, and other Municipal Code policies, the proposed Project will result in a less than significant impact.

As stated previously, the proposed Project will directly increase the number of persons in the area through the addition of 605 new residential units. The Project also provides open space on-site, totaling 5.54 acres, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, and will pay park impact fees according to Municipal Code Chapters 3.04 and 3.10. It is not anticipated that the proposed Project would result in a significant increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial deterioration would occur because the Project includes new recreational facilities for residents within the Project site and provides funding to existing park facilities through required fees.

The proposed Project would not significantly increase the use of an existing park, or other recreational facility. Therefore, it is not anticipated that any substantial physical deterioration of existing facilities would occur or be accelerated. As such, the proposed Project would have a less than significant impact relative to this topic.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different demands for public services compared to the proposed Project. Demand for services would be slightly greater. It is still anticipated that impact fees would be adequate to offset the financial impact on public service providers. Overall, this impact would be slightly greater when compared to the proposed Project.

Transportation and Circulation

The Project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Therefore, based on the TIA Guidelines, the project will have a significant VMT impact. Project design features aim to promote overall mobility with the goal of reducing VMT and reducing greenhouse gas emissions. Implementation of these Project design features may possibly reduce the Project's VMT by approximately up to 1.18 percent. The Project design features can help offset some of the VMT impacts of the Project, but will not reduce the impact to a less than significant level. Therefore, the Project will have a significant and unavoidable relative to this topic.

Results of the LOS analysis shows that all intersections and roadway segments are forecast to operate at a satisfactory LOS under Near-Term (2028) Plus Project conditions with the exception of 10 intersections and 3 roadway segments; And all intersections and roadway segments are forecast to operate at a satisfactory LOS under Cumulative (2046) Plus Project Conditions with the exception of 15 intersections and 10 roadway segments.

Improvements have been recommended at study intersections and roadway segments where an operational deficiency has been identified based on the results of the LOS analysis. It should be noted the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, both the ramp intersections are projected to have queuing deficiencies under future conditions (near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. The intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under near-term, and cumulative scenarios with implementation of this improvement. Further, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Recommended improvements for roadway segments for all analysis scenarios. It should be noted that the segment of Fowler Avenue, between Ticonderoga and Shepherd Avenue is forecast to operate at a deficient LOS under Cumulative (2046) without and plus project conditions. However, this segment is designated as a Rural collector (2-lanes) in the City's General Plan Circulation Element, and already constructed as per the General Plan Circulation Element designation. Additionally, the Project is not estimated to add any traffic at this segment during either peak hours. Therefore, no improvement has been recommended for this roadway segment.

With recommended improvements, all intersections would operate at LOS D or better with the addition of Project trips. Furthermore, in the absence of a fee program where the Project has an impact on the roadway network, the Project will pay its respective fair share for the proposed improvements. Therefore, implementation of the proposed Project would not result in a conflict with an existing or planned pedestrian facility, bicycle facility, or transit service/facility. Because the proposed Project would not conflict with adopted programs, plans, policies, or ordinances that address the circulation system, including transit, bicycle, and pedestrian facilities; this impact is considered less than significant.

The preliminary site plan indicates adequate emergency access would be provided and there do not appear to be any geometric hazards. Furthermore, a sight distance analysis was conducted at the Project driveways. Based on the sight distance analysis, the proposed Project driveways achieve adequate sight distances and have clear sight triangles for drivers.

With consideration to pedestrian safety to nearby schools, a signal should be installed at the project access intersection under the with marked crosswalks and other safety improvements. As such, a safe walking route to the elementary school would be present for elementary school students from the Project.

All Project access intersections, internal intersections, and internal roadways are anticipated to be carefully designed to ensure they can accommodate emergency vehicles, subject to approval of the City of Clovis. All intersections and street sections would be reviewed by the City of Clovis and designed to comply with typical City standards.

Additionally, the proposed Project would not conflict with any program, plan, ordinance, or policy addressing the circulation system, substantially increase hazards due to a geometric feature, or result in inadequate emergency access. Therefore, implementation of the proposed Project would be less than significant relative to this topic.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different traffic generation, distribution, and VMT compared to the proposed Project. Traffic generation, distribution, and VMT would be slightly greater. It is still anticipated that installation of recommended improvements and payment of impact fees would be adequate to offset the level of services impacts, but VMT would be greater. Overall, this impact would be slightly greater when compared to the proposed Project.

Utilities

The installation of the wastewater collection and conveyance system, water supply systems, and stormwater infrastructure to serve the proposed Project would have a less than significant impact relative to this topic.

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The proposed Project would not result in insufficient water supplies available to serve the Project from existing entitlements and resources. Therefore, the proposed Project would result in a less than significant impact to water supplies.

The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The proposed stormwater collection system functions through storm drainage collection, treatment, and discharge. The exact sizing of the underground piping will be engineered during the preparation of the improvement plans, which will be in coordination with FMFCD. The proposed storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB) and City of Clovis regulations; Phase II, National Pollutant Discharge Elimination System (NPDES) Permit Requirements; NPDES-MS4 Permit Requirements; and LID Guidelines.

Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Per CalRecycle generation rate estimates, the Development Area is estimated to generate roughly 12 pounds per household per day[6]. It is estimated that the proposed 605 residential units would generate approximately 7,400 pounds per day of solid waste. The total solid waste generated by the proposed Project is estimated to be 3.4 tons per day. This equates to roughly 0.17 percent of the total allowable daily maximum disposal at the Clovis Landfill and would not cause an exceedance of the landfill's remaining capacity. Therefore, the City's projected increase in solid waste generation associated with future buildout of the proposed Project is expected to be within

---

[6] Note: data based on CalRecycle estimated solid waste generation rates for single family residential uses.; 12.23 lbs./household/day. (CalRecycle, 2022A).

the permitted capacities of landfills utilized by the City. Based on the estimated closure dates of the Clovis Landfill in 2047 and the American Avenue Landfill in 2031, development under the proposed Project would not result in a significant impact on landfill capacity. This is a less than significant impact.

Electrical services are provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along Shepherd Avenue and from existing residential development surrounding the Project site. PG&E and AT&T operate and maintain transmission and distribution infrastructure in the Project area. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Although the proposed Project would increase demand for electricity, and telecommunications facilities, utility improvements would be installed in conjunction with planned street improvements. Although the Project would require construction of new electrical facilities within the site, these improvements would be limited to connections to existing facilities near the Project site. The proposed Project would not result in the relocation or construction of new or expanded electrical, and telecommunications facilities, the construction or relocation of which could cause significant environmental effects. This is a less than significant impact.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different demands for utility services compared to the proposed Project. Demand for utilities would be slightly greater. It is still anticipated all utility providers could serve this alternative; however, this impact would be slightly greater when compared to the proposed Project.

REDUCED DENSITY ALTERNATIVE

Aesthetics and Visual Resources

As described in Section 3.1, the visual character of the Project site would be altered as a result of Project implementation. Implementation of the City’s design standards would ensure quality and cohesive design of the Project site. These standards include specifications for building height, massing, and orientation, exterior lighting standards, and landscaping standards. Following the City’s design requirements will produce a project that will be internally cohesive, while maintaining and aesthetic feel similar to that of the surrounding uses. The Clovis General Plan EIR concluded that adoption of the General plan which contemplated urbanization of the lands within the General Plan study area, was a less than significant environmental impact.

There are no designated State Scenic Highways in the vicinity of the Project site. No officially designated State scenic highways are located in the City of Clovis. The nearest eligible State scenic highway to the City is State Route 168, which is located in Fresno County northeast of the City of Clovis. The City of Clovis and the Project site are not visible from this roadway segment. Additionally, there are no “eligible” highway segments in the Project vicinity that may be included in the State Scenic Highway system.

The proposed Project would be required to implement existing City regulations aimed at reducing light and glare impacts to ensure that no unusual daytime glare or nighttime lighting is produced. Specifically, the Clovis Development Code states that direct glare shall not be permitted and provides standards for nuisance prevention and shielding requirements. Section 9.22.050 of the Clovis Development Code contains standards and provisions related to exterior lighting. Implementation of regulations and standards within the Clovis Development Code would reduce impacts associated with increased light and glare to a less than significant level.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in a different density and mix of land uses, but overall, it would not substantially impact the visual character or quality of the Project site or its surroundings, damage scenic resources within a State Scenic Highway, or potentially significant new sources of light and glare. As such, this impact would be largely equal when compared to the proposed Project.

Agricultural Resources

Currently, the majority of the Project site is vacant agricultural land. Development of the proposed Project would result in the permanent conversion of approximately 63.60 acres of Prime Farmland and 11.44 acres of Farmland of Statewide Importance, as designated by the California Department of Conservation on the June 2020 Important Farmlands Map to nonagricultural use. The California Land Evaluation and Site Assessment (LESA) Model was utilized to determine the proposed Project's potential impact on agricultural resources. The LESA scoring for the proposed Project shows that the conversion of the land on the Project site is not considered significant according to the California Department of Conservation' established thresholds.

The Project site is not under a Williamson Act Contract, and the proposed pre-zoning is consistent with the urban uses anticipated by the City under the adopted General Plan. There is no immediately adjacent agricultural land that poses a potential for conflict. Development of the proposed Project was found to have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in the same land conversion as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Air Quality

To achieve attainment with the standards, the SJVAPCD has established thresholds of significance for criteria pollutant emissions. Projects with emissions below the thresholds of significance for criteria pollutants would be determined to "Not conflict or obstruct implementation of the District's air quality plan."

CalEEMod^{TM} (v.2020.4.0) was used to model operational emissions of the proposed Project. The SJVAPCD has established their thresholds of significance by which the Project emissions are compared against to determine the level of significance. If the proposed Project's emissions will exceed the SJVAPCD's threshold of significance for operational-generated emissions, the proposed Project will have a significant impact on air quality and all feasible mitigation are required to be implemented to reduce emissions to the extent feasible. It was found that operational emissions would not exceed any of the SJVACPD operational thresholds of significance.

The proposed Project would comply with pre-existing requisite federal, State, SJVAPCD, and other local regulations and requirements, as well as implement the control measures provided by the SJVAPCD for construction-related PM_{10} emissions. Compliance with the existing rules and regulations would ensure that the Project's criteria pollutant emissions would be considered to have a less than significant impact.

Substantial concentrations of carbon monoxide are not expected at or along any streets or intersections affected by the development of the Project site. Residences would not be located within 500 feet of a freeway or high-traffic road, or be within any of the other CARB minimum separation recommendations on siting sensitive land uses. Regardless, the proposed Project would not have land uses that would generate a significant risk of public exposure to TACs.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different emissions compared to the proposed Project. Emissions would be slightly less, as there would be fewer homes and residents. Overall, this impact would be slightly less when compared to the proposed Project.

Biological Resources

The biological analysis showed that there were no special-status invertebrates, or their habitat, observed within the Project site during field surveys and none are expected to be affected by the proposed Project. The Project site also does not contain suitable aquatic or upland habitat for special status reptiles or amphibians known to occur in the region. It was determined during the field survey the that the agricultural disturbance on the project site precludes the existence of special-status plants unless agricultural operations were to cease. The Project site does not contain protected wetlands or other jurisdictional areas and there is no need for permitting associated with the Federal or State Clean Water Acts. There are no sensitive natural communities within the Project site. The land uses within the Project site would not have any direct disturbance to the San Joaquin River or its tributaries, and therefore, would not have any direct disturbance to the movement corridor or habitat. The proposed Project is not subject to a Habitat Conservation Plan. The proposed Project requires the removal of the pecan orchard within the Development Area. Pecan trees are fruit trees and are, thus, exempt from the tree removal and replacement requirements.

The Project would result in the removal of an orchard, which is not high-quality nesting or foraging habitat for special-status birds. Powerlines and trees located in the region represent potentially suitable nesting habitat for a variety of special-status birds. Additionally, the agricultural land with low growing crops or grasslands represents potentially suitable nesting habitat for the ground-nesting birds. In general, most nesting occurs from late February and early March through late

July and early August, depending on various environmental conditions. The CNDDB does not provide any records of special status birds on the Project site, or in the immediate vicinity. Nevertheless, birds are highly mobile and can be expected to fly over the Project site at times. They could use the site for foraging, although it is not high-quality habitat for foraging. The Project site does not contain high quality nesting habitat for special status birds given that it is an orchard.

New sources of noise and light during the construction and operational phases of the project could adversely affect nesters if they located adjacent to the Project site in any given year. Additionally, the proposed Project would eliminate the open undeveloped land on the Project site, which could serve as limited foraging habitat for birds throughout the year. Mitigation Measure 3.4-1 requires preconstruction surveys for active nests of special-status birds and buffers around nests should they be identified during the surveys. Development of the proposed Project, with the Mitigation Measure 3.4-1, would ensure that potential impacts to special-status birds are reduced to a less than significant level.

Development of the Project site would eliminate foraging habitat for special-status bats by removing the agricultural areas. These special-status bat species, or evidence of bat presence (i.e. guano), were not observed during the field surveys and have not been documented on the Project site; therefore, they are not expected to be directly affected. Implementation of Mitigation Measure 3.4-2 requires surveys for active maternity roosts if removal of suitable roosting areas (i.e., buildings, trees, shrubs, bridges, etc.) must occur during the bat pupping season (April 1 through July 31). If a special-status bat maternity roost is located, appropriate buffers around the roost sites would be required. Therefore, development of the proposed Project with Mitigation Measure 3.4.2, would ensure that potential impacts to special status bat species are reduced to a less than significant impact.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in the same habitat conversion as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Cultural and Tribal Resources

The Project site encompasses approximately 77-acre for physical development, and 78 acres for non-development entitlements. The Project site is not located in an area known to have historical and archaeological resources, however, as with most projects in the region that involve ground-disturbing activities, there is the potential for discovery of a previously unknown historical and archaeological resources. Implementation Mitigation Measure 3.5-1 would ensure that this impact is less than significant. Additionally, while no human remains were found during field surveys of the Project site, implementation of the Mitigation Measure 3.5-1 would ensure that all construction activities which inadvertently discover human remains implement state-required consultation methods to determine the disposition and historical significance of any discovered human remains. Implementation of Mitigation Measure 3.5-1 would ensure that the potential impact to disturb human remains, including those interred outside of formal cemeteries to a less than significant level.

The City of Clovis sent outreach letters to the twelve tribal representatives listed in the NAHC response. While no specific resources have been identified through consultation with affiliated tribes, it is possible that unknown tribal cultural resources may be present within the Development Area. The Proposed Project would be required to follow development requirements, including compliance with local policies, ordinances, and applicable permitting procedures related to protection of tribal resources. Implementation of Mitigation Measure 3.5-1 would ensure that the potential impact to tribal resources*, including human remains, would be* less than significant.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in the same potential to disturb or destroy cultural, historic, archaeological, and tribal resources as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Geology and Soils

The Project site is subject to potential ground shaking caused by seismic activity. All construction will be designed in accordance with the latest seismic design standards of the California Building Code. These design standards and requirements are intended to minimize impacts to structures in seismically active areas of California. The Project site has a low risk of seismic-related ground failure as a result of liquefication. Landslide potential on the Project site is also low to non-existent. The Project site does not have a significant risk of becoming unstable as a result landslide, subsidence, soil collapse, liquefaction, liquefaction induced settlement, or lateral spreading. The soils on the Project site have a low shrink-swell potential. A final soils report will be performed at a design-level to ensure that the foundations, structures, roadway sections, sidewalks, and other improvements can accommodate the specific soils, including expansive soils, at those locations.

Septic tanks or septic systems are not proposed as part of the Development Area and will not be installed to serve the Development area. The residences within the Non-development Area are currently on septic systems. There are no new residences proposed in this area, and no new septic systems would be installed. This area would be part of the SOI expansion, but would not be part of the annexation. At some future date, if those residents decided to annex into the City, they would be required to connect to the City of Clovis wastewater collection and treatment system and destroy the existing septic systems.

The Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and are existing regulatory requirements.

The Project site is not expected to contain subsurface paleontological resources, it is possible that undiscovered paleontological resources could be encountered during ground-disturbing activities. Implementation of Mitigation Measure 3.6-1 would ensure steps would be taken to reduce impacts to paleontological resources in the event that they are discovered during construction, including stopping work in the event potential resources are found, evaluation of the resource by a qualified paleontologist and appropriate handling of any potential resource. This mitigation measure would reduce this impact to a less than significant level.

There are no past or current commercial mining operations within the Project site. Development of the proposed Project would have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in the same potential for geologic hazards as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Greenhouse Gases, Climate Change and Energy

Estimated maximum mitigated GHG emissions associated with construction of the proposed Project are estimated at a maximum of approximately 776.8 MT CO_2e per year. The annual mitigated GHG emissions associated with operations of the proposed Project would be approximately 5,071 MT CO_2e.

The proposed Project is estimated to generate approximately 2,097 residents during the Project's operational phase.[7] Dividing this number of estimated residents generated by the Project by the total annual operational GHG emissions at Project buildout yields approximately 2.42 MT CO_2e/SP/Year, which is below the 2.62 MT CO_2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Construction emissions, when amortized[8], would equal approximately emissions 25.9 MT CO_2e, which is equivalent to approximately 0.01 MT CO_2e/SP/Year. Therefore, the total annual GHG emissions at Project buildout would still yield approximately 2.43 MT CO_2e/SP/Year, after inclusion of the amortized construction emissions.

GHG emissions associated the proposed Project are below the derived GHG threshold; therefore, the proposed Project would not affect statewide GHG reduction goals. The proposed Project would generate GHG emissions, directly and indirectly, that would not exceed the 2.62 MT CO2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Therefore, the proposed Project's greenhouse gas emissions would be considered to have a less than significant impact relative to this topic.

Electricity used by the proposed Project would be used primarily to generate energy for the residential homes, landscape lighting, and street lighting. As shown in the following tables, "Energy" is one of the categories that was modeled for GHG emissions. The total unmitigated and mitigated GHG emissions generated from the "Energy" category during Project operation is 1,231 CO_2e.

---

[7] This estimate is based on the estimate provided by LSA in their Transportation Impact Analysis (LSA, 2023).

[8] The amortization period used for this calculation is 30 years.

The proposed Project would generate operational vehicle trips that would use a total of approximately 2,100 gallons of gasoline and 341 gallons of diesel per day, or 341,321 gallons of gasoline and 69,484 gallons of diesel per year.

The proposed Project would use a total of approximately 18,955 gallons of diesel fuel for off-road construction vehicles.

The proposed Project would use energy resources for the operation of Project buildings (electricity), outdoor lighting (electricity), for on-road vehicle trips (e.g. gasoline and diesel fuel) rerouted by the proposed Project, and from off-road and on-road construction activities associated with the proposed Project (e.g. diesel fuel). Each of these activities would require the use of energy resources. The proposed Project would be responsible for conserving energy, to the extent feasible, and relies heavily on reducing per capita energy consumption to achieve this goal, including through statewide and local measures.

The proposed Project would be in compliance with all applicable federal, State, and local regulations regulating energy usage. For example, PG&E, the electric and natural gas provider to the proposed Project, is responsible for the mix of energy resources used to provide electricity for its customers, and it is in the process of implementing the statewide RPS to increase the proportion of renewable energy (e.g. solar and wind) within its energy portfolio. PG&E has achieved at least a 33% mix of renewable energy resources in 2020 and is on track to achieve 60% mix of renewable energy by 2030. Other statewide measures, including those intended to improve the energy efficiency of the statewide passenger and heavy-duty truck vehicle fleet (e.g. the Pavley Bill and the Low Carbon Fuel Standard), would improve vehicle fuel economies, thereby conserving gasoline and diesel fuel. These energy savings would continue to accrue over time.

The proposed Project would comply with all existing energy standards and would not be expected to result in significant adverse impacts on energy resources. For these reasons, the proposed Project would not cause an inefficient, wasteful, or unnecessary use of energy resources nor cause a significant impact on any of the thresholds as described by the *CEQA Guidelines*. This is a less than significant impact.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This increased density would result in greater operational emissions, and slightly more construction emissions when compared to the proposed Project.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different emissions compared to the proposed Project. Emissions would be slightly less, as there were be fewer homes and residents. Overall, this impact would be slightly less when compared to the proposed Project.

Hazards and Hazardous Materials

Site Assessment: Based on the review of historical aerial photographs, a site reconnaissance, and contacts with the local regulatory agencies, there is evidence that PAOCs exist in connection with the historical uses of the Development Area. During the course of the Phase I ESA, no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs) and historical RECs (HRECs) were identified in conjunction with the Development Area as defined by ASTM E 1527-13. However, the following potential areas of concern (PAOCs) presented and discussed in Section 3.8 Hazards. The Project site is not on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. Overall, proposed Project would have a less than significant impact with regards to this environmental issue.

Construction Phase: Further, construction workers and the general public could be exposed to hazards and hazardous materials as a result of improper handling or use during construction activities (particularly by untrained personnel); transportation accidents; or fires, or other emergencies. Construction workers could also be exposed to hazards associated with accidental releases of hazardous materials, which could result in significant impacts to the health and welfare of people and/or wildlife. Additionally, an accidental release into the environment could result in the contamination of water, habitat, and countless resources. Compliance with existing regulatory requirements of the Regional Water Quality Control Board would require the preparation of a project specific Stormwater Pollution Prevention Plan (SWPPP). The SWPPP is required to include project specific best management measures that are designed to control erosion and the loss of topsoil to the extent practicable using best management practices (BMPs) that the RWQCB has deemed effective in controlling erosion, sedimentation, and runoff during construction activities.

The proposed Project would also be required to comply with regulations on the transportation of hazardous materials codified in 49 CFR 173 and 49 CFR 177 and CCR Title 26, Division 6. These regulations, which are under the jurisdiction of Caltrans and the CHP, provide specific packaging requirements, define unacceptable hazardous materials shipments, and prescribe safe-transit practices by carriers of hazardous materials. Compliance with these regulations would reduce the risk of exposure to humans and the environment related to the transportation of hazardous materials.

Construction specifications would include the following requirements in compliance with applicable regulations and codes, including, but not limited to, CCR Titles 8 and 22, Uniform Fire Code, and Division 20 of the California Health and Safety Code: all reserve fuel supplies and hazardous materials must be stored within the confines of a designated construction area; equipment refueling and maintenance must take place only within the staging area; and construction vehicles shall be inspected daily for leaks. Off-site activities (e.g., utility construction) would also be required to comply with these regulations. These regulations and codes must be implemented, as appropriate, and are monitored by the State and/or local jurisdictions, including the FCEHS.

Contractors would be required to comply with Cal-EPA’s Unified Program; regulated activities would be managed by FCEHS, the designated Certified Unified Program Agency for Fresno County, in accordance with the regulations included in the Unified Program (e.g., hazardous materials release response plans and inventories, California UFC hazardous material management plans and inventories).

Overall, consistency with federal, State, and local laws and regulations related to the handling of hazardous materials discussed above and implementation of Mitigation Measures 3.8-1 and 3.8-2 would ensure that these potential impacts are reduced to a less than significant level.

Operational Phase: The operational phase of the proposed Project will occur after construction is completed and residents move in to occupy the structures on a day-to-day basis. The proposed Project includes the development of residential structures. Each of these uses will likely use a variety of hazardous materials commonly found in urban areas including: paints, cleaners, and cleaning solvents. If handled appropriately, these materials do not pose a significant risk. These facilities will store and use these materials. There will be a risk of release of these materials into the environment if they are not stored and handled in accordance with best management practices approved by FCEHS and the Clovis Fire Department.

Airports: There are no documented public airports or public use airports within close proximity to the Project site.

Emergency Evacuation and Wildfire: In Fresno County, all major roads are available for evacuation, depending on the location and type of emergency that arises. The proposed Project does not include any actions that would impair or physically interfere with any of Fresno County's emergency plans or evacuation routes. Construction activities are not expected to result in any unknown significant road closures, traffic detours, or congestion that could hinder the emergency vehicle access or evacuation in the event of an emergency. Any construction project that could involve road closures, traffic detours and congestion, shall be required to obtain traffic control plans approved by the City as the lead agency.

The Project site is not categorized as a "Very High" FHSZ by CalFire. The Project site is not located within an LRA and is categorized as Urban Unzoned or Non-Wildland/Non-Urban. The Project site is located in an area that is predominately single-family residential uses, which do not pose a significant risk of wildfire.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in the same potential for hazards as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Hydrology and Water Quality

Construction: In accordance with the NPDES Stormwater Program, the Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and the existing regulatory requirements. Further, the Project would be required to incorporate appropriate erosion and sediment control measures per Section 9.110.040 of the City's Municipal Code and adhere to the City's landscape standards designed to reduce runoff and control soil erosion. Compliance with the Construction General Permit and applicable City grading regulations would ensure that the proposed Project would have a less than significant impact relative to this topic.

Operational: The long-term operations of the proposed Project could result in long-term impacts to surface water quality from urban stormwater runoff. The proposed Project would result in new impervious areas associated with roadways, driveways, and residential structures. The Project site will include construction of a new storm drainage system, which will conform to applicable standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations, standards, and specifications. This includes, but not limited to, the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. BMPs will be implemented through the SWPPP program, and compliance with existing standards and rules, including the implementation of BMPs, would ensure that the proposed Project would have a less than significant impact relative to this topic.

Infiltration/Natural Recharge: The proposed Project would result in new impervious surfaces and could reduce rainwater infiltration and groundwater recharge. The infiltration rate of the soils on the Project site ranges from low to high. This cementation inhibits infiltration of surface water into the soil stratum below the hardpan. Therefore, it can be presumed that the Project site generally does not allow for a high level of groundwater recharge in its existing condition. Development of the Project site with impervious surfaces is unlikely to reduce rainwater infiltration and groundwater recharge when compared to existing conditions. The open space areas of the development totaling approximately 5.54 acres will remain largely pervious. The collection of rainwater for those areas of impervious surfaces will be routed into the proposed Project's storm drainage system and eventually flow into the San Joaquin River.

Groundwater Extraction: Since the 2015 UWMP, SGMA has become effective, and the City is working collaboratively with other agencies reliant on the groundwater basin to reach sustainable management of the groundwater aquifer prior to 2040. The supply from groundwater sources has been modified to reflect this change in the City's supply portfolio. The projected groundwater supply in the 2020 UWMP shows it decreasing to the estimated sustainable amount of 9,400 AFY. (Provost & Pritchard, 2021B). The overall water supply is met with an increase in surface and recycled water sources to offset the reduced use of groundwater resources.

Groundwater supply projections include approved developments outside of the City boundaries, but within the planning area, and estimated groundwater pumping by others within the planning area. The projected groundwater supply reliability does not account for groundwater pumping outside the City planning area, nor undocumented privately owned domestic or irrigation wells. Groundwater use may increase as population increases, and groundwater use by others (including school districts and agricultural users) may also increase in single dry years and multiple dry years (when surface water cutbacks occur).

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The water supply for the City as a whole is shifting more toward surface water supplies since 2015 and will continue on that path through 2040 to ensure compliance with the Kings sub basin groundwater sustainability plan (GSP).

Stormwater Quality: Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Flooding: The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The Project site is subject to flood inundation as a result of dam failure. Regular inspection by DSD and maintenance by the dam owners ensure that the dams are kept in safe operating conditions. As such, failure of these dams is considered to have an extremely low probability of occurring and is not considered to be a reasonably foreseeable event.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in the same potential for impacts to hydrology and water quality as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Land Use, Population, and Housing

The Project site is located directly north of the City of Clovis limit line and is adjacent primarily to undeveloped agricultural land, rural residential land, and low-density residential uses. The Project site would result in an extension of developed uses within an area of the City that currently has approved development plans within the vicinity of the Project site. The Project would provide roadways and pedestrian pathways to connect the Project site to the existing circulation system and to allow access to and from the site. Development of the Project site would not result in physical barriers, such as a highway, wall, or other division, that would divide an existing community, but would serve as an orderly extension of existing and planned developments. The proposed Project would have no impact with regard to the physical division of an established community. The proposed Project would not displace substantial numbers of people or existing housing.

The proposed Project would not conflict with the General Plan. The pre-zoning would go into effect upon annexation into the City of Clovis. The proposed zone change would ensure that zoning will be consistent with the proposed General Plan designation within the Development Area. The City will review each component of the proposed Project as plans (improvement plans, building plans, site plans, etc.) are submitted for final approval to ensure that they are consistent with the City's Zoning ordinance. Approval of the pre-zoning will ensure that the proposed Project will be consistent with the Zoning Code. The proposed Project is consistent with LAFCo policies adopted to address environmental impacts.

The proposed infrastructure improvements would be adequately sized to serve the proposed Project only. The proposed infrastructure would not be oversized to accommodate any growth beyond the Project site into areas that were not previously served. While the proposed Project will result in growth, it is not anticipated to significantly induce growth. Implementation of the proposed Project will have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would not result in a conflict with land use, zoning, or policies. The reduced density of residential uses, however, would be more compatible with the neighbors to the north compared to the proposed Project. As such, this impact would be less when compared to the proposed Project.

Noise

When comparing existing plus project levels to existing levels, Sunnyside Avenue from Project Intersection 1 to Shepherd Avenue has the potential for significant impact as the only roadway segment with an increase of more than 3 dB. The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses, but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls. These walls must be at least 4.2 lbs/ft^2. Any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6- foot sound walls.

The proposed Project would include typical residential noise sources which would be compatible with the adjacent existing residential uses (a.k.a. neighborhood traffic, yard equipment, truck deliveries, garbage collected, etc.). Proposed neighborhood parks are located internal to the Project site and would not impact off-site residential uses.

Based upon a 25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to be approximately 44 dB L_{dn}. Therefore, this is a less than significant impact.

During the construction of the Project, including roads, water, sewer lines, and related infrastructure, noise from construction activities would add to the noise environment in the Project vicinity. Construction noise is considered a short-term impact and would be considered significant if construction activities are taken outside the allowable times as described in the City of Clovis Municipal Code Section 5.27.604. Construction is anticipated to occur during the permissible hours according to the City's Municipal Code. Construction noise will have a temporary or periodic increase in the ambient noise level above the existing within the Project vicinity. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Noise levels will be the loudest during the grading phase. The modeling assumes construction equipment as close as 25 feet from the adjacent residences and an average of 550 feet away from the adjacent residences. Unmitigated noise levels at 550 feet have the potential to reach 60 dBA Leq and 92 dBA Lmax at the nearest sensitive receptors during grading. Noise levels for the other construction phases would be lower, approximately from 46 to 59 dBA Leq and 86 to 93 dBA Lmax. This would be a 13 dB Leq daytime increase in the ambient noise level at the residents along Perrin Rd., Purdue Ave., and East Lexington Ave.

Furthermore, noise reduction policies within the General Plan and standards within the Municipal Code are provided to further reduce construction noise.

The construction of the proposed Project would not require the use of equipment such as pile drivers, which are known to generate substantial construction vibration levels. The primary vibration source during construction may be from a bulldozer or other earthmoving/grading equipment, which is calculated to be below the vibration impact threshold.

The Project site is outside the Fresno Yosemite International Airport noise contours and there are no private airstrips, public airports, or public use airports within two miles of the Project site.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly lower travel and use characteristics compared to the proposed Project. Noise generated by traffic would be slightly lower. Construction noise would largely be the same. As such, this impact would be slightly less when compared to the proposed Project.

Public Services and Recreation

The proposed Project will create an increased demand for public services such as police protection, fire services, school services, and recreation compared to existing conditions. To the extent that the Project would have an incremental increase in demand on public services, the Project would be required to pay the impact fees to assure that the current level of service goals of the City are met. Impact fees from new development are collected based upon projected impacts from each development. The adequacy of impact fees is reviewed periodically to ensure that the fee is commensurate with the service. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund capital and labor costs associated with police services.

The Project does not propose and would not create a need for new or physically altered public service facilities to maintain acceptable service ratios, response times, or other performance objectives. Therefore, the Project would not result in adverse physical impacts associated with such facilities.

The Project proposes to include open space totaling approximately 5.54 acres on-site, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, which would not provide the park land needed to meet the four acres per 1,000 people. However, Municipal Code Chapter 3.4, Park Acquisition and Development, states that any developer who plans for dwelling units to be constructed in the City shall pay, in addition to any other fees required to be paid by the City, a fee which shall be calculated on the basis of park acreage designated in the Clovis General Plan consisting of the estimated total land acquisition and construction cost distributed on the basis of the remaining developable area within the sphere of influence. In accordance with the Municipal Code, fees are deposited in specific funds that shall be used solely for the acquisition, improvement and expansion of public parks and recreation facilities as outlined in the park acquisition and improvement fee update. Thus, upon provision and dedication of the proposed parkland and/or payment of required fees in accordance with the Clovis Municipal Code Chapter 3.04, and other Municipal Code policies, the proposed Project will result in a less than significant impact.

As stated previously, the proposed Project will directly increase the number of persons in the area through the addition of 605 new residential units. The Project also provides open space on-site, totaling 5.54 acres, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, and will pay park impact fees according to Municipal Code Chapters 3.04 and 3.10. It is not anticipated that the proposed Project would result in a significant increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial deterioration would occur because the Project includes new recreational facilities for residents within the Project site and provides funding to existing park facilities through required fees.

The proposed Project would not significantly increase the use of an existing park, or other recreational facility. Therefore, it is not anticipated that any substantial physical deterioration of existing facilities would occur or be accelerated. As such, the proposed Project would have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different demands for public services compared to the proposed Project. Demand for services would be slightly less, as there were be fewer homes and residents. It is still anticipated that impact fees would be adequate to offset the financial impact on public service providers. Overall, this impact would be slightly less when compared to the proposed Project.

Transportation and Circulation

The Project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Therefore, based on the TIA Guidelines, the project will have a significant VMT impact. Project design features aim to promote overall mobility with the goal of reducing VMT and reducing greenhouse gas emissions. Implementation of these Project design features may possibly reduce the Project's VMT by approximately up to 1.18 percent. The Project design features can help offset some of the VMT impacts of the Project, but will not reduce the impact to a less than significant level. Therefore, the Project will have a significant and unavoidable relative to this topic.

Results of the LOS analysis shows that all intersections and roadway segments are forecast to operate at a satisfactory LOS under Near-Term (2028) Plus Project conditions with the exception of 10 intersections and 3 roadway segments; And all intersections and roadway segments are forecast to operate at a satisfactory LOS under Cumulative (2046) Plus Project Conditions with the exception of 15 intersections and 10 roadway segments.

Improvements have been recommended at study intersections and roadway segments where an operational deficiency has been identified based on the results of the LOS analysis. It should be noted the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, both the ramp intersections are projected to have queuing deficiencies under future conditions (near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. The intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under near-term, and cumulative scenarios with implementation of this improvement. Further, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Recommended improvements for roadway segments for all analysis scenarios. It should be noted that the segment of Fowler Avenue, between Ticonderoga and Shepherd Avenue is forecast to operate at a deficient LOS under Cumulative (2046) without and plus project conditions. However, this segment is designated as a Rural collector (2-lanes) in the City's General Plan Circulation Element, and already constructed as per the General Plan Circulation Element designation. Additionally, the Project is not estimated to add any traffic at this segment during either peak hours. Therefore, no improvement has been recommended for this roadway segment.

With recommended improvements, all intersections would operate at LOS D or better with the addition of Project trips. Furthermore, in the absence of a fee program where the Project has an impact on the roadway network, the Project will pay its respective fair share for the proposed improvements. Therefore, implementation of the proposed Project would not result in a conflict with an existing or planned pedestrian facility, bicycle facility, or transit service/facility. Because the proposed Project would not conflict with adopted programs, plans, policies, or ordinances that address the circulation system, including transit, bicycle, and pedestrian facilities; this impact is considered less than significant.

The preliminary site plan indicates adequate emergency access would be provided and there do not appear to be any geometric hazards. Furthermore, a sight distance analysis was conducted at the Project driveways. Based on the sight distance analysis, the proposed Project driveways achieve adequate sight distances and have clear sight triangles for drivers.

With consideration to pedestrian safety to nearby schools, a signal should be installed at the project access intersection under the with marked crosswalks and other safety improvements. As such, a safe walking route to the elementary school would be present for elementary school students from the Project.

All Project access intersections, internal intersections, and internal roadways are anticipated to be carefully designed to ensure they can accommodate emergency vehicles, subject to approval of the City of Clovis. All intersections and street sections would be reviewed by the City of Clovis and designed to comply with typical City standards.

Additionally, the proposed Project would not conflict with any program, plan, ordinance, or policy addressing the circulation system, substantially increase hazards due to a geometric feature, or result in inadequate emergency access. Therefore, implementation of the proposed Project would be less than significant relative to this topic.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly less traffic generation, distribution, and VMT compared to the proposed Project. Traffic generation, distribution, and total VMT would be slightly less. It is still anticipated that installation of recommended improvements and payment of impact fees would be adequate to offset the level of services impacts. Total VMT would be less, but per capita VMT would be approximately the same. Overall, this impact would be slightly less when compared to the proposed Project.

Utilities

The installation of the wastewater collection and conveyance system, water supply systems, and stormwater infrastructure to serve the proposed Project would have a less than significant impact relative to this topic.

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The proposed Project would not result in insufficient water supplies available to serve the Project from existing entitlements and resources. Therefore, the proposed Project would result in a less than significant impact to water supplies.

The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The proposed stormwater collection system functions through storm drainage collection, treatment, and discharge. The exact sizing of the underground piping will be engineered during the preparation of the improvement plans, which will be in coordination with FMFCD. The proposed storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB) and City of Clovis regulations; Phase II, National Pollutant Discharge Elimination System (NPDES) Permit Requirements; NPDES-MS4 Permit Requirements; and LID Guidelines.

Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Per CalRecycle generation rate estimates, the Development Area is estimated to generate roughly 12 pounds per household per day[9]. It is estimated that the proposed 605 residential units would generate approximately 7,400 pounds per day of solid waste. The total solid waste generated by the proposed Project is estimated to be 3.4 tons per day. This equates to roughly 0.17 percent of the total allowable daily maximum disposal at the Clovis Landfill and would not cause an exceedance of the landfill's remaining capacity. Therefore, the City's projected increase in solid waste generation associated with future buildout of the proposed Project is expected to be within the permitted capacities of landfills utilized by the City. Based on the estimated closure dates of the Clovis Landfill in 2047 and the American Avenue Landfill in 2031, development under the proposed Project would not result in a significant impact on landfill capacity. This is a less than significant impact.

Electrical services are provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along Shepherd Avenue and from existing residential development surrounding the Project site. PG&E and AT&T operate and maintain transmission and distribution infrastructure in the Project area. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Although the proposed Project would increase demand for electricity, and telecommunications facilities, utility improvements would be installed in conjunction with planned street improvements. Although the Project would require construction of new electrical facilities within the site, these improvements would be limited to connections to existing facilities near the Project site. The proposed Project would not result in the relocation or construction of new or expanded electrical, and telecommunications facilities, the construction or relocation of which could cause significant environmental effects. This is a less than significant impact.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site, however, the mix of land uses and zoning would change. These differences would result in slightly different demands for utility services compared to the proposed Project. Demand for utility services would be slightly less, as there would be fewer homes and residents. Overall, this impact would be slightly less when compared to the proposed Project.

REDUCED SPHERE OF INFLUENCE ALTERNATIVE

Aesthetics and Visual Resources

As described in Section 3.1, the visual character of the Project site would be altered as a result of Project implementation. Implementation of the City's design standards would ensure quality and cohesive design of the Project site. These standards include specifications for building height, massing, and orientation, exterior lighting standards, and landscaping standards. Following the

---

[9] Note: data based on CalRecycle estimated solid waste generation rates for single family residential uses.; 12.23 lbs./household/day. (CalRecycle, 2022A).

City's design requirements will produce a project that will be internally cohesive, while maintaining and aesthetic feel similar to that of the surrounding uses. The Clovis General Plan EIR concluded that adoption of the General plan which contemplated urbanization of the lands within the General Plan study area, was a less than significant environmental impact.

There are no designated State Scenic Highways in the vicinity of the Project site. No officially designated State scenic highways are located in the City of Clovis. The nearest eligible State scenic highway to the City is State Route 168, which is located in Fresno County northeast of the City of Clovis. The City of Clovis and the Project site are not visible from this roadway segment. Additionally, there are no "eligible" highway segments in the Project vicinity that may be included in the State Scenic Highway system.

The proposed Project would be required to implement existing City regulations aimed at reducing light and glare impacts to ensure that no unusual daytime glare or nighttime lighting is produced. Specifically, the Clovis Development Code states that direct glare shall not be permitted and provides standards for nuisance prevention and shielding requirements. Section 9.22.050 of the Clovis Development Code contains standards and provisions related to exterior lighting. Implementation of regulations and standards within the Clovis Development Code would reduce impacts associated with increased light and glare to a less than significant level.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site and has physically the same impacts. Overall, this alternative would not substantially impact the visual character or quality of the Project site or its surroundings, damage scenic resources within a State Scenic Highway, or potentially significant new sources of light and glare. As such, this impact would be largely equal when compared to the proposed Project.

Agricultural Resources

Currently, the majority of the Project site is vacant agricultural land. Development of the proposed Project would result in the permanent conversion of approximately 63.60 acres of Prime Farmland and 11.44 acres of Farmland of Statewide Importance, as designated by the California Department of Conservation on the June 2020 Important Farmlands Map to nonagricultural use. The California Land Evaluation and Site Assessment (LESA) Model was utilized to determine the proposed Project's potential impact on agricultural resources. The LESA scoring for the proposed Project shows that the conversion of the land on the Project site is not considered significant according to the California Department of Conservation' established thresholds.

The Project site is not under a Williamson Act Contract, and the proposed pre-zoning is consistent with the urban uses anticipated by the City under the adopted General Plan. There is no immediately adjacent agricultural land that poses a potential for conflict. Development of the proposed Project was found to have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site. The elimination of the Non-Development Area from this alternative would have no physical benefits relative to this topic. This alternative would result in the same land conversion as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Air Quality

To achieve attainment with the standards, the SJVAPCD has established thresholds of significance for criteria pollutant emissions. Projects with emissions below the thresholds of significance for criteria pollutants would be determined to "Not conflict or obstruct implementation of the District's air quality plan."

CalEEMod^{TM} (v.2020.4.0) was used to model operational emissions of the proposed Project. The SJVAPCD has established their thresholds of significance by which the Project emissions are compared against to determine the level of significance. If the proposed Project's emissions will exceed the SJVAPCD's threshold of significance for operational-generated emissions, the proposed Project will have a significant impact on air quality and all feasible mitigation are required to be implemented to reduce emissions to the extent feasible. It was found that operational emissions would not exceed any of the SJVACPD operational thresholds of significance.

The proposed Project would comply with pre-existing requisite federal, State, SJVAPCD, and other local regulations and requirements, as well as implement the control measures provided by the SJVAPCD for construction-related PM_{10} emissions. Compliance with the existing rules and regulations would ensure that the Project's criteria pollutant emissions would be considered to have a less than significant impact.

Substantial concentrations of carbon monoxide are not expected at or along any streets or intersections affected by the development of the Project site. Residences would not be located within 500 feet of a freeway or high-traffic road, or be within any of the other CARB minimum separation recommendations on siting sensitive land uses. Regardless, the proposed Project would not have land uses that would generate a significant risk of public exposure to TACs.

These impacts would be similar with the Reduced Sphere of Influence Alternative and has physically the same impacts. This would result in equal operational emissions, and equal construction emissions when compared to the proposed Project.

Biological Resources

The biological analysis showed that there were no special-status invertebrates, or their habitat, observed within the Project site during field surveys and none are expected to be affected by the proposed Project. The Project site also does not contain suitable aquatic or upland habitat for special status reptiles or amphibians known to occur in the region. It was determined during the field survey the that the agricultural disturbance on the project site precludes the existence of special-status plants unless agricultural operations were to cease. The Project site does not contain protected wetlands or other jurisdictional areas and there is no need for permitting associated with the Federal or State Clean Water Acts. There are no sensitive natural communities within the Project site. The land uses within the Project site would not have any direct disturbance to the San Joaquin River or its tributaries, and therefore, would not have any direct disturbance to the movement corridor or habitat. The proposed Project is not subject to a Habitat Conservation Plan. The proposed Project requires the removal of the pecan orchard within the Development Area. Pecan trees are fruit trees and are, thus, exempt from the tree removal and replacement requirements.

The Project would result in the removal of an orchard, which is not high-quality nesting or foraging habitat for special-status birds. Powerlines and trees located in the region represent potentially suitable nesting habitat for a variety of special-status birds. Additionally, the agricultural land with low growing crops or grasslands represents potentially suitable nesting habitat for the ground-nesting birds. In general, most nesting occurs from late February and early March through late July and early August, depending on various environmental conditions. The CNDDB does not provide any records of special status birds on the Project site, or in the immediate vicinity. Nevertheless, birds are highly mobile and can be expected to fly over the Project site at times. They could use the site for foraging, although it is not high-quality habitat for foraging. The Project site does not contain high quality nesting habitat for special status birds given that it is an orchard.

New sources of noise and light during the construction and operational phases of the project could adversely affect nesters if they located adjacent to the Project site in any given year. Additionally, the proposed Project would eliminate the open undeveloped land on the Project site, which could serve as limited foraging habitat for birds throughout the year. Mitigation Measure 3.4-1 requires preconstruction surveys for active nests of special-status birds and buffers around nests should they be identified during the surveys. Development of the proposed Project, with the Mitigation Measure 3.4-1, would ensure that potential impacts to special-status birds are reduced to a less than significant level.

Development of the Project site would eliminate foraging habitat for special-status bats by removing the agricultural areas. These special-status bat species, or evidence of bat presence (i.e. guano), were not observed during the field surveys and have not been documented on the Project site; therefore, they are not expected to be directly affected. Implementation of Mitigation Measure 3.4-2 requires surveys for active maternity roosts if removal of suitable roosting areas (i.e., buildings, trees, shrubs, bridges, etc.) must occur during the bat pupping season (April 1 through July 31). If a special-status bat maternity roost is located, appropriate buffers around the roost sites would be required. Therefore, development of the proposed Project with Mitigation Measure 3.4.2, would ensure that potential impacts to special status bat species are reduced to a less than significant impact.

These impacts would be similar with the Reduced Density Alternative as this alternative is located on the same site. This alternative would result in the same habitat conversion as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Cultural and Tribal Resources

The Project site encompasses approximately 77-acre for physical development, and 78 acres for non-development entitlements. The Project site is not located in an area known to have historical and archaeological resources, however, as with most projects in the region that involve ground-disturbing activities, there is the potential for discovery of a previously unknown historical and archaeological resources. Implementation Mitigation Measure 3.5-1 would ensure that this impact is less than significant. Additionally, while no human remains were found during field surveys of the Project site, implementation of the Mitigation Measure 3.5-1 would ensure that all construction activities which inadvertently discover human remains implement state-required consultation methods to determine the disposition and historical significance of any discovered human remains. Implementation of Mitigation Measure 3.5-1 would ensure that the potential impact to disturb human remains, including those interred outside of formal cemeteries to a less than significant level.

The City of Clovis sent outreach letters to the twelve tribal representatives listed in the NAHC response. While no specific resources have been identified through consultation with affiliated tribes, it is possible that unknown tribal cultural resources may be present within the Development Area. The Proposed Project would be required to follow development requirements, including compliance with local policies, ordinances, and applicable permitting procedures related to protection of tribal resources. Implementation of Mitigation Measure 3.5-1 would ensure that the potential impact to tribal resources*, including human remains, would be* less than significant.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site. This alternative would result in the same potential to disturb or destroy cultural, historic, archaeological, and tribal resources as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Geology and Soils

The Project site is subject to potential ground shaking caused by seismic activity. All construction will be designed in accordance with the latest seismic design standards of the California Building Code. These design standards and requirements are intended to minimize impacts to structures in seismically active areas of California. The Project site has a low risk of seismic-related ground failure as a result of liquefication. Landslide potential on the Project site is also low to non-existent. The Project site does not have a significant risk of becoming unstable as a result landslide, subsidence, soil collapse, liquefaction, liquefaction induced settlement, or lateral spreading. The soils on the Project site have a low shrink-swell potential. A final soils report will be performed at a design-level to ensure that the foundations, structures, roadway sections, sidewalks, and other improvements can accommodate the specific soils, including expansive soils, at those locations.

Septic tanks or septic systems are not proposed as part of the Development Area and will not be installed to serve the Development area. The residences within the Non-development Area are currently on septic systems. There are no new residences proposed in this area, and no new septic systems would be installed. This area would be part of the SOI expansion, but would not be part of the annexation. At some future date, if those residents decided to annex into the City, they would be required to connect to the City of Clovis wastewater collection and treatment system and destroy the existing septic systems.

The Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and are existing regulatory requirements.

The Project site is not expected to contain subsurface paleontological resources, it is possible that undiscovered paleontological resources could be encountered during ground-disturbing activities. Implementation of Mitigation Measure 3.6-1 would ensure steps would be taken to reduce impacts to paleontological resources in the event that they are discovered during construction, including stopping work in the event potential resources are found, evaluation of the resource by a qualified paleontologist and appropriate handling of any potential resource. This mitigation measure would reduce this impact to a less than significant level.

There are no past or current commercial mining operations within the Project site. Development of the proposed Project would have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site. This alternative would result in the same potential for geologic hazards as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Greenhouse Gases, Climate Change and Energy

Estimated maximum mitigated GHG emissions associated with construction of the proposed Project are estimated at a maximum of approximately 776.8 MT CO_2e per year. The annual mitigated GHG emissions associated with operations of the proposed Project would be approximately 5,071 MT CO_2e.

The proposed Project is estimated to generate approximately 2,097 residents during the Project's operational phase.[10] Dividing this number of estimated residents generated by the Project by the total annual operational GHG emissions at Project buildout yields approximately 2.42 MT CO_2e/SP/Year, which is below the 2.62 MT CO_2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Construction emissions, when amortized[11], would equal approximately emissions 25.9 MT CO_2e, which is equivalent to approximately 0.01 MT CO_2e/SP/Year. Therefore, the total annual GHG emissions at Project buildout would still yield approximately 2.43 MT CO_2e/SP/Year, after inclusion of the amortized construction emissions.

---

[10] This estimate is based on the estimate provided by LSA in their Transportation Impact Analysis (LSA, 2023).

[11] The amortization period used for this calculation is 30 years.

GHG emissions associated the proposed Project are below the derived GHG threshold; therefore, the proposed Project would not affect statewide GHG reduction goals. The proposed Project would generate GHG emissions, directly and indirectly, that would not exceed the 2.62 MT CO2e/SP/year in 2030 threshold based on emissions for the land use-driven emission sectors in the CARB GHG Inventory. Therefore, the proposed Project's greenhouse gas emissions would be considered to have a less than significant impact relative to this topic.

Electricity used by the proposed Project would be used primarily to generate energy for the residential homes, landscape lighting, and street lighting. As shown in the following tables, "Energy" is one of the categories that was modeled for GHG emissions. The total unmitigated and mitigated GHG emissions generated from the "Energy" category during Project operation is 1,231 CO_2e.

The proposed Project would generate operational vehicle trips that would use a total of approximately 2,100 gallons of gasoline and 341 gallons of diesel per day, or 341,321 gallons of gasoline and 69,484 gallons of diesel per year.

The proposed Project would use a total of approximately 18,955 gallons of diesel fuel for off-road construction vehicles.

The proposed Project would use energy resources for the operation of Project buildings (electricity), outdoor lighting (electricity), for on-road vehicle trips (e.g. gasoline and diesel fuel) rerouted by the proposed Project, and from off-road and on-road construction activities associated with the proposed Project (e.g. diesel fuel). Each of these activities would require the use of energy resources. The proposed Project would be responsible for conserving energy, to the extent feasible, and relies heavily on reducing per capita energy consumption to achieve this goal, including through statewide and local measures.

The proposed Project would be in compliance with all applicable federal, State, and local regulations regulating energy usage. For example, PG&E, the electric and natural gas provider to the proposed Project, is responsible for the mix of energy resources used to provide electricity for its customers, and it is in the process of implementing the statewide RPS to increase the proportion of renewable energy (e.g. solar and wind) within its energy portfolio. PG&E has achieved at least a 33% mix of renewable energy resources in 2020 and is on track to achieve 60% mix of renewable energy by 2030. Other statewide measures, including those intended to improve the energy efficiency of the statewide passenger and heavy-duty truck vehicle fleet (e.g. the Pavley Bill and the Low Carbon Fuel Standard), would improve vehicle fuel economies, thereby conserving gasoline and diesel fuel. These energy savings would continue to accrue over time.

The proposed Project would comply with all existing energy standards and would not be expected to result in significant adverse impacts on energy resources. For these reasons, the proposed Project would not cause an inefficient, wasteful, or unnecessary use of energy resources nor cause a significant impact on any of the thresholds as described by the *CEQA Guidelines*. This is a less than significant impact.

These impacts would be similar with the Increased Density Mixed Use Alternative as this alternative is located on the same site. This increased density would result in greater operational emissions, and slightly more construction emissions when compared to the proposed Project.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site and has the same land uses and zoning. As such, this impact would be equal when compared to the proposed Project.

Hazards and Hazardous Materials

Site Assessment: Based on the review of historical aerial photographs, a site reconnaissance, and contacts with the local regulatory agencies, there is evidence that PAOCs exist in connection with the historical uses of the Development Area. During the course of the Phase I ESA, no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs) and historical RECs (HRECs) were identified in conjunction with the Development Area as defined by ASTM E 1527-13. However, the following potential areas of concern (PAOCs) presented and discussed in Section 3.8 Hazards. The Project site is not on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. Overall, proposed Project would have a less than significant impact with regards to this environmental issue.

Construction Phase: Further, construction workers and the general public could be exposed to hazards and hazardous materials as a result of improper handling or use during construction activities (particularly by untrained personnel); transportation accidents; or fires, or other emergencies. Construction workers could also be exposed to hazards associated with accidental releases of hazardous materials, which could result in significant impacts to the health and welfare of people and/or wildlife. Additionally, an accidental release into the environment could result in the contamination of water, habitat, and countless resources. Compliance with existing regulatory requirements of the Regional Water Quality Control Board would require the preparation of a project specific Stormwater Pollution Prevention Plan (SWPPP). The SWPPP is required to include project specific best management measures that are designed to control erosion and the loss of topsoil to the extent practicable using best management practices (BMPs) that the RWQCB has deemed effective in controlling erosion, sedimentation, and runoff during construction activities.

The proposed Project would also be required to comply with regulations on the transportation of hazardous materials codified in 49 CFR 173 and 49 CFR 177 and CCR Title 26, Division 6. These regulations, which are under the jurisdiction of Caltrans and the CHP, provide specific packaging requirements, define unacceptable hazardous materials shipments, and prescribe safe-transit practices by carriers of hazardous materials. Compliance with these regulations would reduce the risk of exposure to humans and the environment related to the transportation of hazardous materials.

Construction specifications would include the following requirements in compliance with applicable regulations and codes, including, but not limited to, CCR Titles 8 and 22, Uniform Fire Code, and Division 20 of the California Health and Safety Code: all reserve fuel supplies and hazardous materials must be stored within the confines of a designated construction area;

equipment refueling and maintenance must take place only within the staging area; and construction vehicles shall be inspected daily for leaks. Off-site activities (e.g., utility construction) would also be required to comply with these regulations. These regulations and codes must be implemented, as appropriate, and are monitored by the State and/or local jurisdictions, including the FCEHS.

Contractors would be required to comply with Cal-EPA's Unified Program; regulated activities would be managed by FCEHS, the designated Certified Unified Program Agency for Fresno County, in accordance with the regulations included in the Unified Program (e.g., hazardous materials release response plans and inventories, California UFC hazardous material management plans and inventories).

Overall, consistency with federal, State, and local laws and regulations related to the handling of hazardous materials discussed above and implementation of Mitigation Measures 3.8-1 and 3.8-2 would ensure that these potential impacts are reduced to a less than significant level.

Operational Phase: The operational phase of the proposed Project will occur after construction is completed and residents move in to occupy the structures on a day-to-day basis. The proposed Project includes the development of residential structures. Each of these uses will likely use a variety of hazardous materials commonly found in urban areas, including paints, cleaners, and cleaning solvents. If handled appropriately, these materials do not pose a significant risk. These facilities will store and use these materials. There will be a risk of release of these materials into the environment if they are not stored and handled in accordance with best management practices approved by FCEHS and the Clovis Fire Department.

Airports: There are no documented public airports or public use airports within close proximity to the Project site.

Emergency Evacuation and Wildfire: In Fresno County, all major roads are available for evacuation, depending on the location and type of emergency that arises. The proposed Project does not include any actions that would impair or physically interfere with any of Fresno County's emergency plans or evacuation routes. Construction activities are not expected to result in any unknown significant road closures, traffic detours, or congestion that could hinder the emergency vehicle access or evacuation in the event of an emergency. Any construction project that could involve road closures, traffic detours and congestion, shall be required to obtain traffic control plans approved by the City as the lead agency.

The Project site is not categorized as a "Very High" FHSZ by CalFire. The Project site is not located within an LRA and is categorized as Urban Unzoned or Non-Wildland/Non-Urban. The Project site is located in an area that is predominately single-family residential uses, which do not pose a significant risk of wildfire.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site. This alternative would result in the same potential for hazards as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Hydrology and Water Quality

Construction: In accordance with the NPDES Stormwater Program, the Project requires an approved SWPPP designed to control erosion and the loss of topsoil to the extent practicable using BMPs that the RWQCB has deemed effective in controlling erosion, sedimentation, runoff during construction activities. The specific controls are subject to the review and approval by the RWQCB and the existing regulatory requirements. Further, the Project would be required to incorporate appropriate erosion and sediment control measures per Section 9.110.040 of the City's Municipal Code and adhere to the City's landscape standards designed to reduce runoff and control soil erosion. Compliance with the Construction General Permit and applicable City grading regulations would ensure that the proposed Project would have a less than significant impact relative to this topic.

Operational: The long-term operations of the proposed Project could result in long-term impacts to surface water quality from urban stormwater runoff. The proposed Project would result in new impervious areas associated with roadways, driveways, and residential structures. The Project site will include construction of a new storm drainage system, which will conform to applicable standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations, standards, and specifications. This includes, but not limited to, the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. BMPs will be implemented through the SWPPP program, and compliance with existing standards and rules, including the implementation of BMPs, would ensure that the proposed Project would have a less than significant impact relative to this topic.

Infiltration/Natural Recharge: The proposed Project would result in new impervious surfaces and could reduce rainwater infiltration and groundwater recharge. The infiltration rate of the soils on the Project site ranges from low to high. This cementation inhibits infiltration of surface water into the soil stratum below the hardpan. Therefore, it can be presumed that the Project site generally does not allow for a high level of groundwater recharge in its existing condition. Development of the Project site with impervious surfaces is unlikely to reduce rainwater infiltration and groundwater recharge when compared to existing conditions. The open space areas of the development totaling approximately 5.54 acres will remain largely pervious. The collection of rainwater for those areas of impervious surfaces will be routed into the proposed Project's storm drainage system and eventually flow into the San Joaquin River.

Groundwater Extraction: Since the 2015 UWMP, SGMA has become effective, and the City is working collaboratively with other agencies reliant on the groundwater basin to reach sustainable management of the groundwater aquifer prior to 2040. The supply from groundwater sources has been modified to reflect this change in the City's supply portfolio. The projected groundwater supply in the 2020 UWMP shows it decreasing to the estimated sustainable amount of 9,400 AFY. (Provost & Pritchard, 2021B). The overall water supply is met with an increase in surface and recycled water sources to offset the reduced use of groundwater resources.

Groundwater supply projections include approved developments outside of the City boundaries, but within the planning area, and estimated groundwater pumping by others within the planning area. The projected groundwater supply reliability does not account for groundwater pumping outside the City planning area, nor undocumented privately owned domestic or irrigation wells. Groundwater use may increase as population increases, and groundwater use by others (including school districts and agricultural users) may also increase in single dry years and multiple dry years (when surface water cutbacks occur).

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The water supply for the City as a whole is shifting more toward surface water supplies since 2015 and will continue on that path through 2040 to ensure compliance with the Kings sub basin groundwater sustainability plan (GSP).

Stormwater Quality: Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Flooding: The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The Project site is subject to flood inundation as a result of dam failure. Regular inspection by DSD and maintenance by the dam owners ensure that the dams are kept in safe operating conditions.

As such, failure of these dams is considered to have an extremely low probability of occurring and is not considered to be a reasonably foreseeable event.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site. This alternative would result in the same potential for impacts to hydrology and water quality as the proposed Project. As such, this impact would be largely equal when compared to the proposed Project.

Land Use, Population, and Housing

The Project site is located directly north of the City of Clovis limit line and is adjacent primarily to undeveloped agricultural land, rural residential land, and low-density residential uses. The Project site would result in an extension of developed uses within an area of the City that currently has approved development plans within the vicinity of the Project site. The Project would provide roadways and pedestrian pathways to connect the Project site to the existing circulation system and to allow access to and from the site. Development of the Project site would not result in physical barriers, such as a highway, wall, or other division, that would divide an existing community, but would serve as an orderly extension of existing and planned developments. The proposed Project would have no impact with regard to the physical division of an established community. The proposed Project would not displace substantial numbers of people or existing housing.

The proposed Project would not conflict with the General Plan. The pre-zoning would go into effect upon annexation into the City of Clovis. The proposed zone change would ensure that zoning will be consistent with the proposed General Plan designation within the Development Area. The City will review each component of the proposed Project as plans (improvement plans, building plans, site plans, etc.) are submitted for final approval to ensure that they are consistent with the City’s Zoning ordinance. Approval of the pre-zoning will ensure that the proposed Project will be consistent with the Zoning Code. The proposed Project is consistent with LAFCo policies adopted to address environmental impacts.

The proposed infrastructure improvements would be adequately sized to serve the proposed Project only. The proposed infrastructure would not be oversized to accommodate any growth beyond the Project site into areas that were not previously served. While the proposed Project will result in growth, it is not anticipated to significantly induce growth. Implementation of the proposed Project will have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site and has the same land uses and zoning. As such, this impact would be equal when compared to the proposed Project.

Noise

When comparing existing plus project levels to existing levels, Sunnyside Avenue from Project Intersection 1 to Shepherd Avenue has the potential for significant impact as the only roadway segment with an increase of more than 3 dB. The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses, but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls. These walls must be at least 4.2 lbs/ft^2. Any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6- foot sound walls.

The proposed Project would include typical residential noise sources which would be compatible with the adjacent existing residential uses (a.k.a. neighborhood traffic, yard equipment, truck deliveries, garbage collected, etc.). Proposed neighborhood parks are located internal to the Project site and would not impact off-site residential uses.

Based upon a 25-dB exterior-to-interior noise level reduction, interior noise levels are predicted to be approximately 44 dB L_{dn}. Therefore, this is a less than significant impact.

During the construction of the Project, including roads, water, sewer lines, and related infrastructure, noise from construction activities would add to the noise environment in the Project vicinity. Construction noise is considered a short-term impact and would be considered significant if construction activities are taken outside the allowable times as described in the City of Clovis Municipal Code Section 5.27.604. Construction is anticipated to occur during the permissible hours according to the City's Municipal Code. Construction noise will have a temporary or periodic increase in the ambient noise level above the existing within the Project vicinity. Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Noise levels will be the loudest during the grading phase. The modeling assumes construction equipment as close as 25 feet from the adjacent residences and an average of 550 feet away from the adjacent residences. Unmitigated noise levels at 550 feet have the potential to reach 60 dBA Leq and 92 dBA Lmax at the nearest sensitive receptors during grading. Noise levels for the other construction phases would be lower, approximately from 46 to 59 dBA Leq and 86 to 93 dBA Lmax. This would be a 13 dB Leq daytime increase in the ambient noise level at the residents along Perrin Rd., Purdue Ave., and East Lexington Ave.

Furthermore, noise reduction policies within the General Plan and standards within the Municipal Code are provided to further reduce construction noise.

The construction of the proposed Project would not require the use of equipment such as pile drivers, which are known to generate substantial construction vibration levels. The primary vibration source during construction may be from a bulldozer or other earthmoving/grading equipment, which is calculated to be below the vibration impact threshold.

The Project site is outside the Fresno Yosemite International Airport noise contours and there are no private airstrips, public airports, or public use airports within two miles of the Project site.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site and has the same land uses and zoning. As such, this impact would be equal when compared to the proposed Project.

Public Services and Recreation

The proposed Project will create an increased demand for public services such as police protection, fire services, school services, and recreation compared to existing conditions. To the extent that the Project would have an incremental increase in demand on public services, the Project would be required to pay the impact fees to assure that the current level of service goals of the City are met. Impact fees from new development are collected based upon projected impacts from each development. The adequacy of impact fees is reviewed periodically to ensure that the fee is commensurate with the service. Payment of the applicable impact fees by the Project applicant, and ongoing revenues that would come from property taxes, sales taxes, and other revenues generated by the proposed Project, would fund capital and labor costs associated with police services.

The Project does not propose and would not create a need for new or physically altered public service facilities to maintain acceptable service ratios, response times, or other performance objectives. Therefore, the Project would not result in adverse physical impacts associated with such facilities.

The Project proposes to include open space totaling approximately 5.54 acres on-site, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, which would not provide the park land needed to meet the four acres per 1,000 people. However, Municipal Code Chapter 3.4, Park Acquisition and Development, states that any developer who plans for dwelling units to be constructed in the City shall pay, in addition to any other fees required to be paid by the City, a fee which shall be calculated on the basis of park acreage designated in the Clovis General Plan consisting of the estimated total land acquisition and construction cost distributed on the basis of the remaining developable area within the sphere of influence. In accordance with the Municipal Code, fees are deposited in specific funds that shall be used solely for the acquisition, improvement and expansion of public parks and recreation facilities as outlined in the park acquisition and improvement fee update. Thus, upon provision and dedication of the proposed parkland and/or payment of required fees in accordance with the Clovis Municipal Code Chapter 3.04, and other Municipal Code policies, the proposed Project will result in a less than significant impact.

As stated previously, the proposed Project will directly increase the number of persons in the area through the addition of 605 new residential units. The Project also provides open space on-site, totaling 5.54 acres, including 2.25 acres of trails, 2.39 acres of promenade/pedestrian circulation, and 0.90 acres of parks, and will pay park impact fees according to Municipal Code Chapters 3.04 and 3.10. It is not anticipated that the proposed Project would result in a significant increase in the use of existing neighborhood and regional parks or other recreational facilities such that substantial deterioration would occur because the Project includes new recreational facilities for residents within the Project site, and provides funding to existing park facilities through required fees.

The proposed Project would not significantly increase the use of an existing park, or other recreational facility. Therefore, it is not anticipated that any substantial physical deterioration of existing facilities would occur or be accelerated. As such, the proposed Project would have a less than significant impact relative to this topic.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site and has the same land uses and zoning. As such, this impact would be equal when compared to the proposed Project.

Transportation and Circulation

The Project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Therefore, based on the TIA Guidelines, the project will have a significant VMT impact. Project design features aim to promote overall mobility with the goal of reducing VMT and reducing greenhouse gas emissions. Implementation of these Project design features may possibly reduce the Project's VMT by approximately up to 1.18 percent. The Project design features can help offset some of the VMT impacts of the Project, but will not reduce the impact to a less than significant level. Therefore, the Project will have a significant and unavoidable relative to this topic.

Results of the LOS analysis shows that all intersections and roadway segments are forecast to operate at a satisfactory LOS under Near-Term (2028) Plus Project conditions with the exception of 10 intersections and 3 roadway segments; And all intersections and roadway segments are forecast to operate at a satisfactory LOS under Cumulative (2046) Plus Project Conditions with the exception of 15 intersections and 10 roadway segments.

Improvements have been recommended at study intersections and roadway segments where an operational deficiency has been identified based on the results of the LOS analysis. It should be noted the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, both the ramp intersections are projected to have queuing deficiencies under future conditions (near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. The intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under near-term, and cumulative scenarios with implementation of this improvement. Further, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Recommended improvements for roadway segments for all analysis scenarios. It should be noted that the segment of Fowler Avenue, between Ticonderoga and Shepherd Avenue is forecast to operate at a deficient LOS under Cumulative (2046) without and plus project conditions. However, this segment is designated as a Rural collector (2-lanes) in the City's General Plan Circulation Element, and already constructed as per the General Plan Circulation Element designation. Additionally, the Project is not estimated to add any traffic at this segment during either peak hours. Therefore, no improvement has been recommended for this roadway segment.

With recommended improvements, all intersections would operate at LOS D or better with the addition of Project trips. Furthermore, in the absence of a fee program where the Project has an impact on the roadway network, the Project will pay its respective fair share for the proposed improvements. Therefore, implementation of the proposed Project would not result in a conflict with an existing or planned pedestrian facility, bicycle facility, or transit service/facility. Because the proposed Project would not conflict with adopted programs, plans, policies, or ordinances that address the circulation system, including transit, bicycle, and pedestrian facilities; this impact is considered less than significant.

The preliminary site plan indicates adequate emergency access would be provided and there do not appear to be any geometric hazards. Furthermore, a sight distance analysis was conducted at the Project driveways. Based on the sight distance analysis, the proposed Project driveways achieve adequate sight distances and have clear sight triangles for drivers.

With consideration to pedestrian safety to nearby schools, a signal should be installed at the project access intersection under the with marked crosswalks and other safety improvements. As such, a safe walking route to the elementary school would be present for elementary school students from the Project.

All Project access intersections, internal intersections, and internal roadways are anticipated to be carefully designed to ensure they can accommodate emergency vehicles, subject to approval of the City of Clovis. All intersections and street sections would be reviewed by the City of Clovis and designed to comply with typical City standards.

Additionally, the proposed Project would not conflict with any program, plan, ordinance, or policy addressing the circulation system, substantially increase hazards due to a geometric feature, or result in inadequate emergency access. Therefore, implementation of the proposed Project would be less than significant relative to this topic.
These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site and has the same land uses and zoning. As such, this impact would be equal when compared to the proposed Project.

Utilities

The installation of the wastewater collection and conveyance system, water supply systems, and stormwater infrastructure to serve the proposed Project would have a less than significant impact relative to this topic.

The technical analyses shows that the total projected water supplies determined to be available for the proposed Project during Normal, Single Dry, and Multiple Dry years during a 20-year projection will meet the projected water demand associated with the proposed Project, in addition to existing and planned future uses. The proposed Project would not result in insufficient water supplies available to serve the Project from existing entitlements and resources. Therefore, the proposed Project would result in a less than significant impact to water supplies.

The majority of the Project site is located within the 500-year flood zone, and the northern and northeastern portion of the Project site is within the 100-year flood zone. It is noted that a small portion in the north of the Development Area is within the 100-year flood zone. The majority of the Development Area within the Project site is located in an area designated to have a minimal flood hazard. The flood zone designation of the site is also not due to a reduced risk from a levee nor is it located within a regulatory floodway.

The portions of the Project site that lie within the 100-year flood zone would require a Letter of Map Revision (LOMR) before development would be allowed. A LOMR is a document that officially revises a portion of the effective FEMA Flood Insurance Rate Map (FIRM) according to requirements and procedures outlined in the National Flood Insurance Program (NFIP) regulations. A LOMR allows FEMA to revise flood hazard information on a FIRM map via letter without physically revising and reprinting the entire map panel. The LOMR will reflect changes in elevation from grading and no flood insurance requirements would be imposed on structures in these areas once the LOMR is approved by FEMA. The LOMR process is a standard requirement for all new construction or substantial improvements of structures to ensure that they are elevated to or above the base flood elevation. Through compliance with these existing regulations, impacts would be less than significant and no new structures would be constructed within the 100-year flood plain.

The proposed stormwater collection system functions through storm drainage collection, treatment, and discharge. The exact sizing of the underground piping will be engineered during the preparation of the improvement plans, which will be in coordination with FMFCD. The proposed storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB) and City of Clovis regulations; Phase II, National Pollutant Discharge Elimination System (NPDES) Permit Requirements; NPDES-MS4 Permit Requirements; and LID Guidelines.

Stormwater quality standards imposed and monitored by the Environmental Protection Agency (EPA) and the SWRCB through the NPDES permit require treatment of stormwater runoff prior to its release into drainage features. Stormwater quality is an integral part of FMFCD's stormwater management system. With the design and construction of flood control improvements included in the proposed storm drainage system in accordance with FMFCD's requirements, the proposed Project would have a less than significant impact relative to this topic.

Per CalRecycle generation rate estimates, the Development Area is estimated to generate roughly 12 pounds per household per day[12]. It is estimated that the proposed 605 residential units would generate approximately 7,400 pounds per day of solid waste. The total solid waste generated by the proposed Project is estimated to be 3.4 tons per day. This equates to roughly 0.17 percent of the total allowable daily maximum disposal at the Clovis Landfill and would not cause an exceedance of the landfill's remaining capacity. Therefore, the City's projected increase in solid waste generation associated with future buildout of the proposed Project is expected to be within the permitted capacities of landfills utilized by the City. Based on the estimated closure dates of the Clovis Landfill in 2047 and the American Avenue Landfill in 2031, development under the proposed Project would not result in a significant impact on landfill capacity. This is a less than significant impact.

Electrical services are provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along Shepherd Avenue and from existing residential development surrounding the Project site. PG&E and AT&T operate and maintain transmission and distribution infrastructure in the Project area. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Although the proposed Project would increase demand for electricity, and telecommunications facilities, utility improvements would be installed in conjunction with planned street improvements. Although the Project would require construction of new electrical facilities within the site, these improvements would be limited to connections to existing facilities near the Project site. The proposed Project would not result in the relocation or construction of new or expanded electrical, and telecommunications facilities, the construction or relocation of which could cause significant environmental effects. This is a less than significant impact.

These impacts would be similar with the Reduced Sphere of Influence Alternative as this alternative is located on the same site and has the same land uses and zoning. As such, this impact would be equal when compared to the proposed Project.

ENVIRONMENTALLY SUPERIOR ALTERNATIVE

CEQA requires that an environmentally superior alternative be identified among the alternatives that are analyzed in the EIR. If the No Project (No Build) Alternative is the environmentally superior alternative, an EIR must also identify an environmentally superior alternative among the other alternatives (CEQA Guidelines Section 15126.6(e)(2)). The environmentally superior alternative is that alternative with the least adverse environmental impacts when compared to the proposed Project.

As Table 5.0-1 presents a comparison of the alternative Project impacts with those of the proposed Project. As shown in the table, the No Project (No Build) Alternative is the environmentally superior alternative. However, as required by CEQA, when the No Project (No

---

[12] Note: data based on CalRecycle estimated solid waste generation rates for single family residential uses.; 12.23 lbs./household/day. (CalRecycle, 2022A).

Build) Alternative is the environmentally superior alternative, the environmentally superior alternative among the others must be identified. Therefore, the Reduced Density Alternative would be the environmentally superior alternative because all environmental issues would have reduced impacts compared to the proposed Project. It is noted that the Reduced Density Alternative does not fully meet all of the Project objectives.

TABLE 5.0-1: COMPARISON OF ALTERNATIVE PROJECT IMPACTS TO THE PROPOSED PROJECT

ENVIRONMENTAL ISSUE	*NO PROJECT (NO BUILD) ALTERNATIVE*	*INCREASED DENSITY MIXED USE ALTERNATIVE*	*REDUCED DENSITY ALTERNATIVE*	*REDUCED SPHERE OF INFLUENCE ALTERNATIVE*
Aesthetics and Visual Resources	Less (Best)	Equal (2nd Best)	Equal (2nd Best)	Equal (2nd Best)
Agricultural Resources	Less (Best)	Equal (2nd Best)	Equal (2nd Best)	Equal (2nd Best)

NOTICE OF PREPARATION

TO:	State Clearinghouse State Responsible Agencies State Trustee Agencies Other Public Agencies Interested Organizations	FROM:	George González, MPA | Senior Planner City of Clovis | Planning Division 1033 Fifth Street Clovis, CA 93612 559.324.2383 georgeg@cityofclovis.com

SUBJECT: Notice of Preparation – Shepherd North Project

Notice is hereby given that the City of Clovis is the lead agency for the preparation of a project-level Environmental Impact Report (EIR) for the proposed Shepherd North Project (proposed Project), in accordance with the California Environmental Quality Act (CEQA), Section 15050. The EIR will consider potential environmental effects of the proposed project to determine the level of significance of the environmental effect and will analyze these potential effects to the detail necessary to make a determination on the level of significance. The EIR will consider those environmental issues which are raised by responsible agencies, trustee agencies, and members of the public or related agencies during the Notice of Preparation (NOP) process.

We need to know the views of your agency or organization as to the scope and content of the environmental information germane to your agency's statutory responsibilities or of interest to your organization in connection with the proposed project. Specifically, we are requesting the following:

1. If you are a public agency, state whether your agency will be a responsible or trustee agency for the proposed project and list the permits or approvals from your agency that will be required for the project and its future actions;
2. Identify significant environmental effects and mitigation measures that you believe need to be explored in the EIR with supporting discussion of why you believe these effects may be significant;
3. Describe special studies and other information that you believe are necessary for the City to analyze the significant environmental effects, alternatives, and mitigation measures you have identified;
4. For public agencies that provide infrastructure and public services, identify any facilities that must be provided (both on- and off-site) to provide services to the proposed project;
5. Indicate whether a member(s) from your agency would like to attend a scoping workshop/meeting for public agencies to discuss the scope and content of the EIR's environmental information; and
6. Provide the name, title, and telephone number of the contact person from your agency or organization that we can contact regarding your comments.

Due to the time limits mandated by State law, your response must be sent and received by the City of Clovis by the following deadlines:

E202210000101

- For responsible agencies, not later than 30 days after you receive this notice.
- For all other agencies and organizations, not later than 30 days following the publication of this Notice of Preparation. The 30-day review period begins Monday, May 9, 2022 and ends on Friday, June 10, 2022.

If we do not receive a response from your agency or organization, we will presume that your agency or organization has no response to make. A responsible agency, trustee agency, or other public agency may request a meeting with the City or its representatives in accordance with Section 15082(c) of the CEQA Guidelines. Please send your response to George González, MPA, Senior Planner at the City of Clovis | Planning Division, 1033 Fifth Street, Clovis, CA 93612. If you have any questions, please contact George González, MPA, Senior Planner at 559.324.2383 or via email at: georgeg@cityofclovis.com.

SCOPING MEETING: A scoping meeting will be held at the City of Clovis Council Chamber, located at 1033 Fifth Street, Clovis, CA 93612 on Wednesday, May 25, 2022 from 6:00 p.m. to 7:00 p.m. If you have any questions, please contact George González, MPA, Senior Planner, at georgeg@cityofclovis.com. If you prefer to attend virtually, you can either enter this link (https://link.edgepilot.com/s/5c99e641/wZoX-PvT8U2lIDc9YNoXwg?u=https://cityofclovis.webex.com/cityofclovis/j.php?MTID=m3e7b645cadafe20bd442b3cbd03f1477) into your web browser prior to the start of the meeting or dial in by phone (no video) at 1-844-992-4726 Access Code: 2492 626 9548.

PROJECT DESCRIPTION: The Project site is north of the City of Clovis limit line at the northeast corner of N. Sunnyside Avenue and E. Shepherd Avenue. The Project site is approximately 155 acres and includes the approximate 77-acre Development Area and the approximate 78-acre Non-Development Area. The Development Area includes the parcels being annexed that will be entitled for subdivision and development of up to 605 residential units, parkland, and public and private infrastructure. The application includes a request for a Sphere of Influence Expansion, General Plan Amendment, Pre-zone, Annexation, Tentative Map, Planned Development Permit, and Residential Site Plan Review. The Non-Development Area includes the parcels being included in the Sphere of Influence (SOI) expansion that will not be entitled for subdivision or development. A detailed Project Description is attached and can be reviewed at the City or by accessing the City's website at https://cityofclovis.com/planning-and-development/planning/ceqa/.

PROBABLE ENVIRONMENTAL EFFECTS AND SCOPE OF THE EIR: The City has reviewed the proposed Project application and has determined that an EIR should be prepared for the proposed Project because it may have a significant effect on the environment. All environmental topics identified in Appendix G of the State CEQA Guidelines require analysis within an EIR including: Aesthetics, Agricultural and Forest Resources, Air Quality, Biological Resources, Cultural Resources, Energy, Geology/Soils, Greenhouse Gases/Climate Change, Hazards and Hazardous Materials, Hydrology/Water Quality, Land Use/Planning, Mineral Resources, Noise, Population/Housing, Public Services, Recreation, Transportation/Circulation, Tribal Resources, Utilities and Service Systems, Cumulative Impacts, and Growth Inducing Impacts. An Initial Study has not been prepared for the proposed Project. As noted above, each environmental topic identified in Appendix G of the State CEQA Guidelines requires analysis in an EIR.

E20221000

PROJECT LOCATION

The Project site is directly north of the City of Clovis limit line at the northeast corner of N. Sunnyside Avenue and E. Shepherd Avenue. The Project site is bounded on the north by Perrin Road, on the east by N. Fowler Avenue, on the south by E. Shepherd Avenue, and on the west by N. Sunnyside Avenue. Figures 1 and 2 show the Project's regional location and vicinity. The Project site is in the southwest ¼ of Section 21, Township 12 South, Range 21 East, Mount Diablo Base and Meridian (MDBM). Figure 3 illustrates the Project location on the USGS Clovis, California, 7.5-minute series quadrangle map.

PROJECT SITE DEFINED

The Project site includes several distinct planning boundaries defined below. The following terms are used throughout this document to describe planning area boundaries within the Project site:

- Project Area – includes the whole of the Project site (approximately 155 acres), including the approximate 77-acre Development Area and the approximate 78-acre Non-Development Area.
- Development Area - includes the parcels being annexed that will be entitled for subdivision and development. This will include a Sphere of Influence Expansion, General Plan Amendment, Pre-zone, Annexation, Tentative Map, Planned Development Permit, and Residential Site Plan Review.
- Non-Development Area - includes the parcels being included in the Sphere of Influence (SOI) expansion that will not be entitled for subdivision or development. This includes two separate areas, each described as an Expansion SubArea. The two Expansion SubAreas total 78 acres and are defined as Expansion SubArea North and Expansion SubArea East.

PROJECT SETTING

EXISTING SITE CONDITIONS

The Project site is approximately 155 acres and includes 39 Assessor parcels (APNs). Figure 4 illustrates the APNs.

SITE TOPOGRAPHY

The Project site is relatively flat and is approximately 385 feet above mean sea level.

EXISTING SITE USES

The Development Area primarily contains farmland (orchard), and had three residential dwellings and a warehouse that was removed in approximately 2020. The majority of the Development Area is in active agricultural use (pecan orchards).

There are five agricultural water wells located in the Development Area, two located along the east-west centerline of the area, one located in the southwestern corner of the area, one located in the northwestern corner of the area and one located along the eastern boundary of the Development Area. There are four pole-mounted transformers in the Development Area. Two pole-mounted transformers

E20221000

are located in the central-eastern portion of the Development Area, and two are located along the eastern boundary of the Development Area in the southern portion. Along the eastern boundary of the Development Area are two large berms approximately 10 to 12 feet tall containing wood branches and debris from pruning the orchard.

The Non-Development Area contains existing single-family residences and agricultural fields. The Non-Development Area is located within the City of Clovis' Planning Area but is outside of the City's existing Sphere of Influence. Each SubArea is uniquely different and is described below:

Expansion SubArea North includes single-family residences that are accessed by N. Purdue Avenue and Lexington. N. Purdue Avenue and Lexington are unimproved roadways with no pedestrian sidewalk, curb/gutter, or landscaping. N. Sunnyside Avenue located to the west and Perrin Road to the north are also unimproved County roadways. There are 18 accessor parcels in SubArea North.

Expansion SubArea East is located between the pecan orchards and N. Fowler Avenue and consists of existing single-family residences and agricultural fields. There are 18 accessor parcels in SubArea East. North Fowler Avenue is a two-lane unimproved County roadway with no pedestrian sidewalk, curb/gutter, or landscaping.

Figure 5 shows aerial imagery of the existing site uses within the Project site.

EXISTING SURROUNDING USES

The Project site is surrounded by a variety of agricultural and residential land uses. Uses immediately adjacent to the north and east boundary of the Project site include rural residential uses on larger lots, some having small orchards or other agricultural activities. Uses to the south of the Project site include a mix of residential uses, including rural residential on larger lots and medium-high density residential in a developed smaller lot residential subdivision. West of the Project site are single-family residential uses, agricultural uses (orchard) and a power sub-station.

EXISTING GENERAL PLAN LAND USE DESIGNATIONS AND ZONING

The following section outlines the City and County General Plan land use designations and zoning for the Project site. It should be noted that the Project site is currently outside of the jurisdiction of the City of Clovis, and therefore does not have a City of Clovis zoning.

City of Clovis

The City of Clovis General Plan was adopted on August 25, 2014. Figure 6 depicts the land use designations for the Project site and the surrounding areas under the adopted City of Clovis General Plan. The Project site is designated as Rural Residential (RR) under the City of Clovis General Plan.

The General Plan contains standards to guide development for this land use, as noted below:

Rural Residential (RR): Very low density residential uses and small scale agricultural operations. Rural residential uses may be dispersed uniformly across the land or be sited so to leave more acreage for

orchards, pastures, or other agricultural or open space activities. The allowable maximum density for this land use designation is one dwelling unit per two acres.

Fresno County

Figure 7 identifies the Fresno County land use designations and zoning for the Project site and the surrounding area. The Development Area is designated as Low Density Residential by the County's General Plan Land Use Map and is zoned AL-20 (Limited Agricultural) by the County. The Non-Development Area is designated as Rural Residential by the County's General Plan Land Use Map and is zoned RR (Rural Residential) by the County.

PROJECT GOALS AND OBJECTIVES

Consistent with CEQA Guidelines Section 15124(b), a clear statement of objectives and the underlying purpose of the proposed Project shall be discussed.

PROJECT OBJECTIVES

The principal objective of the proposed Project is the expansion of the City's SOI to include the Project site, and the annexation, approval and subsequent development of the Development Area.

The quantifiable objectives include the development of 605 single family residential units. The quantifiable objectives include the development of open space totaling 4.32 acres, including 1.49 acres of private park and recreational uses. The Project objectives also include the installation of new public and private roadways that will provide pedestrian and vehicular access to the Project site and surrounding community areas, and other improvements, including water supply, storm drainage, sewer facilities and landscaping to serve the residential uses.

The goals of the proposed development are as follows:

- Provide residential housing opportunities that are visually attractive and accommodate the future housing demand in Clovis.
- Establish a mixture of housing types, sizes and densities that collectively provide for local and regional housing demand.
- Provide infrastructure that meets City standards and is integrated with existing and planned facilities and connections.
- Establish a logical phasing plan designed to ensure that each phase of development would include necessary public improvements required to meet City standards.
- Expand the City's Sphere of Influence in order to establish a logical and orderly boundary that promotes the efficient extension of municipal services.

E202210000101

PROJECT ENTITLEMENTS

GENERAL PLAN AMENDMENT

The proposed Project would require a General Plan Land Use Amendment to adjust the land uses from Rural Residential (RR) to Low Density (L) and Medium High Density (MH) for the Development Area to accommodate the proposed development density.

- **Low Density (L)**. This designation identifies areas appropriate for conventional single-family detached houses. The allowable density range is 2.1 to 4.0 units per acre.
- **Medium High Density (MH).** This designation identifies areas appropriate small lot single family detached homes, townhouses, duplexes, and apartments. The allowable density range is 7.1 to 15.0 units per acre.

The proposed General Plan land use designations for the Project site is shown on Figure 8.

PRE-ZONING

As previously stated, the Project site is currently outside of the Clovis city limits, and therefore does not have zoning. The proposed Project includes a request for pre-zoning of the Development Area consistent with the proposed General Plan Land Uses.

Development Area: The pre-zoning request is for R-1 and R-1-PRD zoning designations over these lots.

- **R-1 Single-Family Residential Low Density Zoning**. This designation identifies areas appropriate for conventional single-family uses. The allowable density range is 2.1 to 4.0 units per acre, with not more than one dwelling unit per parcel. The R-1 district is consistent with the Low and Medium Density Residential land use designations of the General Plan.
- **R-1-PRD Single-Family Planned Residential Development Zoning.** This designation identifies areas appropriate for single-family small lot uses, including attached and detached single-family structures on small lots. The allowable density range is 4.1 to 15.0 units per acre, with the level of density determined by compliance with performance standards. The R-1-PRD district required a planned development permit. The R-1-PRD district is consistent with the Medium and Medium-High Density Residential land use designation of the General Plan.

The proposed zoning for the Project site is shown on Figure 9.

TENTATIVE SUBDIVISION MAP

The proposed Project includes a Tentative Map for the Development Area of the Project site that would ultimately be developed in phases. The Tentative Map covers approximately 77 acres within three Assessor parcels (APNs). This includes APNs 557-021-20, -19, and -21.

The Tentative Map would result in the subdivision of a total of approximately 77 acres into 605 single family residential units, with an additional 58 out lots for roads, utilities, greenspace, landscaping, and pedestrian paths. The Project objectives also include the installation of new public roadways that will

EZ0221000010

provide pedestrian and vehicular access to the Project site and surrounding community areas, and other improvements, including water supply, storm drainage, sewer facilities and landscaping. Figure 10a, 10b, and 10c illustrate the proposed site plans for the Development Area.

PLANNED DEVELOPMENT PERMIT

The proposed Project includes a Planned Development Permit (PDP) for the Development Area of the Project, which will incorporate a program of enhanced amenities (e.g., additional open space, park improvements and/or trail development). The PDP may allow for modifications to the applicable development standards, such as lot coverage, setbacks and building heights.

ANNEXATION

The proposed Project includes an annexation of three APNs totaling approximately 77 acres. This includes the Development Area.

RESIDENTIAL SITE PLAN REVIEW

The proposed Project includes a Residential Site Plan Review (RSPR) for the Development Area as a condition of a subdivision map implementing provisions of zoning.

SPHERE OF INFLUENCE EXPANSION

The proposed Project includes an amendment of the City's Sphere of Influence (SOI) to include the entirety the approximately 155-acre Project site. The area is currently located in the City's Planning Area, but outside of the City's SOI. The amendment of the City's SOI will require an application and approval by the Fresno Local Agency Formation Commission (LAFCo).

DEVELOPMENT PROJECT CHARACTERISTICS

The proposed Project is primarily a residential development anticipated to provide up to 605 residential units. The Development Project would provide approximately 1.49 acres of private greenspace. Other uses to support and compliment the proposed residential development include public utility infrastructure, public and private roadways, curb/gutters/sidewalks, pedestrian facilities, private parking, street lighting, and street signage.

Development of housing will depend on market conditions and demand. The plan for infrastructure allows for development to occur in phases to respond to the market conditions and demand.

RESIDENTIAL DEVELOPMENT

The proposed Project will provide a variety of housing types and lot sizes that will accommodate a range of housing objectives and buyer needs with a goal to ensure housing for a variety of families and lifestyles. The Development Area will accommodate up to 605 residential units. Specifically, the northern portion of the Development Area would include the development of up to 107 single-family residences with lot sizes ranging from approximately 7,500 square feet to 19,300 square feet. The southern portion of the Development Area would be developed with smaller lot single-family residences, with lot sizes ranging

E202210000101

from approximately 1,980 to 3,800 square feet, and with larger corner lots that are approximately 4,200 to 7,300 square feet. Figure 10a, 10b and 10c illustrate the Project site plans.

GREENSPACE

The proposed Project includes 1.49 acres of private greenspace including a private pool and park area. There are three separate greenspaces proposed, one located in the northern portion of the Development Area, one in the southwestern portion and one in the southeastern portion.

CIRCULATION

The proposed Project includes a hierarchy of roadways to accommodate the capacity needs of the existing street network as well as provide additional vehicular access to the Development Area. N. Sunnyside Avenue and E. Shepherd Avenue are the main arterial roadways providing access to the Development Area.

The neighborhoods within the Development Area will include a network of public and private residential streets to provide an efficient flow of traffic through the area. Additionally, sidewalks will be included per the City standards.

UTILITIES AND PLANNED INFRASTRUCTURE IMPROVEMENTS

The construction of on-site infrastructure improvements would be required to accommodate development of the Development Area, as described below.

Water System

The Project site would be served by a new potable and non-potable water distribution system. The proposed water system will be located within the proposed public utilities easements and be connected to existing City mains and will comply with City Master Plans and standards. The City of Clovis provides water supplies to the City of Clovis. The City has three main water supply sources: groundwater, surface water, and recycled water. The City extracts groundwater from the Kings Subbasin. Surface water is delivered to the City by the Fresno Irrigation District (FID). The various surface water supplies are from the Kings River and Central Valley Project. The City's Water Reuse Facility produces tertiary treated effluent that can be used for agriculture or landscape irrigation.

Wastewater System

The Project site would be served by a new wastewater collection system installed within proposed public utilities easements. The proposed wastewater conveyance facilities would connect to the existing sewer mains as part of the City of Clovis collection and treatment system. Wastewater treatment would be provided at the existing Fresno-Clovis Regional Wastewater Treatment Plant in the City of Fresno. By agreement with the City of Fresno, the City of Clovis is entitled to a maximum capacity of 9.3 million gallons per day (mgd). The Fresno-Clovis Regional Wastewater Treatment Plant is owed and operated by the City of Fresno and has a maximum capacity of 80 mgd. If required, the City has the capability to acquire additional capacity at the Wastewater Treatment Plant. Wastewater treatment would also be provided by the City's Water Reuse Facility. The plant serves the new growth areas of the City in the southeast,

E2022100001

northwest, and ultimately the northeast urban centers. The plant is designed to accommodate future expansion and will ultimately treat 8.4 mgd.

Storm Drainage

The Project site would include construction of a new storm drainage system, which will confirm to the City's standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations. This includes, but not limited to the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. Stormwater throughout the City is collected in FMFCD's basins.

Regulated Public Utilities

Electrical and gas, provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along E. Shepherd Avenue and from existing residential development surrounding the Project site. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Utility improvements would be installed in conjunction with planned street improvements.

ALTERNATIVES

Three alternatives to the proposed Project were developed based on input from City staff. The alternatives that are anticipated to be analyzed in the EIR include the following three alternatives in addition to the proposed Project.

- **No Project (No Build) Alternative**: Under this alternative, development of the Project site would not occur, and the Project site would remain in its current existing condition.
- **Increased Density Alternative:** Under this alternative, the proposed Project would be developed with the same number of units as described in the Project Description, but the density of the residential uses would be increased, reducing the overall footprint of the developed areas and preserving the remaining Development Area for agricultural production.
- **Reduced Sphere of Influence Alternative:** Under this alternative, the proposed Project would exclude the 78-acre SOI Expansion north and east of the Development Area.

NO PROJECT (NO BUILD) ALTERNATIVE

Under the No Project (No Build) Alternative development of the Project site would not occur, and the Project site would remain in its current existing condition. It is noted that the No Project (No Build) Alternative would fail to meet the Project objectives.

INCREASED DENSITY ALTERNATIVE

Under this alternative, the proposed Project would be developed with the same components as described in the Project Description, but density of the residential uses would be increased. Under the Increased Density Alternative, the same number of residential units as the proposed project (607 units) would be constructed within the Development Area. The residential areas would be reduced at increased densities

E202210000107

of approximately 9.8 dwelling units per acre (du/ac) to allow for the preservation of approximately 15 acres agricultural lands. The residential density under the Increased Density Alternative would fall within the allowed density for the City's General Plan designation of Medium High Density Residential (7.1 to 15 du/ac). Under the proposed Project, the residential density would be 5.2 units per gross acre.

REDUCED SPHERE OF INFLUENCE ALTERNATIVE

Under this alternative, the proposed Project would only expand the Sphere of Influence and annex the Developed Area, and would exclude the 78-acre Sphere of Influence (SOI) expansion to the north and east of the Development Area.

USES OF THE EIR AND REQUIRED AGENCY APPROVALS

This EIR may be used for the following direct and indirect approvals and permits associated with adoption and implementation of the proposed Project.

CITY OF CLOVIS

The City of Clovis will be the Lead Agency for the proposed Project, pursuant to the State Guidelines for Implementation of CEQA, Section 15050. Actions that would be required from the City include, but are not limited to the following:

- Certification of the EIR;
- Adoption of the Mitigation Monitoring and Reporting Program;
- Approval of City of Clovis General Plan Amendment (Land Use Element);
- Approval of City of Clovis Zoning Pre-zoning;
- Approval of Residential Site Plan Review;
- Approval of Vesting Tentative Maps;
- Approval of Planned Development Permit;
- Approval of SOI Expansion and Authorization to submit SOI Amendment request to Fresno LAFCo;
- Approval of Annexation of the Development Area and Inhabited Area and Authorization to submit Annexation request to Fresno LAFCo;
- Approval of future Final Maps;
- Approval of future Planned Development Permit;
- Approval of future Grading Plans;
- City review, approval, of construction and utility plans; and
- Approval of future Building Permits.

OTHER GOVERNMENTAL AGENCY APPROVALS

The following agencies may be required to issue permits or approve certain aspects of the proposed Project. Other governmental agencies that may require approval include, but are not limited to, the following:

- Fresno Local Agency Formation Commission (LAFCo) – SOI Amendment, Annexation, and Detachment from Fresno County Fire Protection District and the Kings River Conservation District;

E20221000010

- Central Valley Regional Water Quality Control Board (CVRWQCB) - Storm Water Pollution Prevention Plan (SWPPP) approval prior to construction activities pursuant to the Clean Water Act;
- San Joaquin Valley Air Pollution Control District (SJVAPCD) - Approval of construction-related air quality permits; and
- Fresno Metropolitan Flood Control District – review of stormwater facilities.

STATE OF CALIFORNIA Gavin Newsom, Governor

NATIVE AMERICAN HERITAGE COMMISSION

May 10, 2022

George González
City of Clovis
1033 Fifth Street
Clovis, CA 93611

Re: 2022050180, Shepherd North Project, Fresno County

Dear Mr. González:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

NAHC HEADQUARTERS
1550 Harbor Boulevard
Suite 100
West Sacramento,
California 95691
(916) 373-3710
nahc@nahc.ca.gov
NAHC.ca.gov

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when following occurs:

- **a.** The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or
- **b.** A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

- **a.** Avoidance and preservation of the resources in place, including, but not limited to:
  - **i.** Planning and construction to avoid the resources and protect the cultural and natural context.
  - **ii.** Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.
- **b.** Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:
  - **i.** Protecting the cultural character and integrity of the resource.
  - **ii.** Protecting the traditional use of the resource.
  - **iii.** Protecting the confidentiality of the resource.
- **c.** Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.
- **d.** Protecting the resource. (Pub. Resource Code §21084.3 (b)).
- **e.** Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).
- **f.** Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

- **a.** The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.
- **b.** The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.
- **c.** The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    - **a.** The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    - **b.** Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (https://ohp.parks.ca.gov/?page_id=30331) for an archaeological records search. The records search will determine:
    - **a.** If part or all of the APE has been previously surveyed for cultural resources.
    - **b.** If any known cultural resources have already been recorded on or adjacent to the APE.
    - **c.** If the probability is low, moderate, or high that cultural resources are located in the APE.
    - **d.** If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    - **a.** The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.
    - **b.** The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Cameron.Vela@nahc.ca.gov.

Sincerely,

Cameron Vela

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT FOR THE SHEPHERD NORTH PROJECT – DATED MAY 2022 (STATE CLEARINGHOUSE NUMBER: 2022050180)

Dear Mr. González:

The Department of Toxic Substances Control (DTSC) received a Notice of Preparation of an Environmental Impact Report (EIR) for the Shepherd North Project (Project). The Lead Agency is receiving this notice from DTSC because the Project includes one or more of the following: groundbreaking activities, work in close proximity to a roadway, work in close proximity to mining or suspected mining or former mining activities, presence of site buildings that may require demolition or modifications, importation of backfill soil, and/or work on or in close proximity to an agricultural or former agricultural site.

DTSC recommends that the following issues be evaluated in the Hazards and Hazardous Materials section of the EIR:

1. The EIR should acknowledge the potential for historic or future activities on or near the project site to result in the release of hazardous wastes/substances on the project site. In instances in which releases have occurred or may occur, further studies should be carried out to delineate the nature and extent of the contamination, and the potential threat to public health and/or the environment should be evaluated. The EIR should also identify the mechanism(s) to initiate any required investigation and/or remediation and the government agency who will be responsible for providing appropriate regulatory oversight.

2. Refiners in the United States started adding lead compounds to gasoline in the 1920s in order to boost octane levels and improve engine performance. This practice did not officially end until 1992 when lead was banned as a fuel additive in California. Tailpipe emissions from automobiles using leaded gasoline contained lead and resulted in aerially deposited lead (ADL) being deposited in and along roadways throughout the state. ADL-contaminated soils still exist along roadsides and medians and can also be found underneath some existing road surfaces due to past construction activities. Due to the potential for ADL-contaminated soil, DTSC recommends collecting soil samples for lead analysis prior to performing any intrusive activities for the project described in the EIR.

3. If any sites within the project area or sites located within the vicinity of the project have been used or are suspected of having been used for mining activities, proper investigation for mine waste should be discussed in the EIR. DTSC recommends that any project sites with current and/or former mining operations onsite or in the project site area should be evaluated for mine waste according to DTSC's 1998 Abandoned Mine Land Mines Preliminary Assessment Handbook.

4. If buildings or other structures are to be demolished on any project sites included in the proposed project, surveys should be conducted for the presence of lead-based paints or products, mercury, asbestos containing materials, and polychlorinated biphenyl caulk. Removal, demolition and disposal of any of the above-mentioned chemicals should be conducted in compliance with California environmental regulations and policies. In addition, sampling near current and/or former buildings should be conducted in accordance with DTSC's 2006 *Interim Guidance Evaluation of School Sites with Potential Contamination from Lead Based Paint, Termiticides, and Electrical Transformers*.

5. If any projects initiated as part of the proposed project require the importation of soil to backfill any excavated areas, proper sampling should be conducted to ensure that the imported soil is free of contamination. DTSC recommends the imported materials be characterized according to *DTSC's 2001 Information Advisory Clean Imported Fill Material*.

6. If any sites included as part of the proposed project have been used for agricultural, weed abatement or related activities, proper investigation for organochlorinated pesticides should be discussed in the EIR. DTSC recommends the current and former agricultural lands be evaluated in accordance with DTSC's 2008 *Interim Guidance for Sampling Agricultural Properties (Third Revision)*.

DTSC appreciates the opportunity to comment on the EIR. Should you need any assistance with an environmental investigation, please visit DTSC's Site Mitigation and Restoration Program page to apply for lead agency oversight. Additional information regarding voluntary agreements with DTSC can be found at DTSC's Brownfield website.

If you have any questions, please contact me at (916) 255-3710 or via email at Gavin.McCreary@dtsc.ca.gov.

Sincerely,

Gavin McCreary

Dear Mr. Gonzalez,

My name is Robert Shuman and I live on the north side of the Shepherd North Project on the corner of Perrin and Stanford at 9502 N. Stanford. My wife and I have lived here for 12 years. My mother in law who also lives on the property has been here for 36 years. In my time we have never had any well issues until last summer. I am very concerned that we will lose our well because the Pecans are not being irrigated any longer. The flood irrigation is in my opinion a big part of replenishing our well. It is unfortunate that you guys pulled us out of the SOI. If we lose our well it is because of the expansion of Clovis into the County. I also have other concerns listed below and it should be noted when you begin doing your EIR. I can't stop development, but if I lose my well then I can only blame it on this project along with the Heritage development. I think the residents north of this project should be included in the annexation. I know there are several homeowners along Stanford up to Ticonderoga that have dry wells currently. Please consider this as these homes have been here for many years and it is affecting their way of life. Below I have listed the other concerns and hopefully you will consider them when you go forward with the project.

WATER

Groundwater

The California Supreme Court, in Katz v. Walkinshaw (1903), established the doctrine of correlative groundwater rights, under which every landowner overlying a groundwater basin has the right to extract and use groundwater correlative with the rights of other overlying landowners. This created, in economic terms, a competitive groundwater market where opportunity costs, the fact that water pumped today will result in a lower water table for all future periods, are ignored. A disincentive has been created to conserve or recharge groundwater because the benefits of these investments cannot be fully captured by those who finance them.

Surface Water

No riparian or appropriative rights to surface water exist for the project or adjacent properties. The existing agricultural land has no appropriative surface water rights that can be converted to municipal uses. The SWRCB should be petitioned before diverting surface water to the project to prevent injury to other rights holders.

The project is located in a flat low-lying, flood plain along with many unnamed ephemeral drainages that support a seasonal wetland/flood control structure along behymer and the sunnyside alignment. The headwaters of these ephemeral drainages were severed and diverted to the San Joaquin River as the result of the Little Dry Creek Diversional channel. While the obvious flood control benefits are realized, it has resulted in less natural groundwater recharge in the area. The project site has been artificially elevated and must be evaluated from an pre-agricultural basis.

Public Trust Doc

The Public Trust Doctrine imposes responsibilities on state and local agencies to protect trust resources associated with California's waters and other equally important natural resources. A water right is an estate in real property, including a correlative right to groundwater extraction, must be protected. Property owners who rely on groundwater must rely on certainty to make investments and be economically productive. Continued erosion of groundwater availability will undoubtedly impact investment in surrounding real property and create economic hardship. Small pumpers who rely on groundwater for domestic uses will be disproportionately affected by this project and cumulative effects of similar developments.

Therefore, if the City intends to approve this development appropriate mitigation measures must be incorporated into the project in perpetuity due to the irreversible damage to the water resources.

1. Consider Low-Impact Development (LID) measures that capture and infiltrate stormwater on-site. In addition, LID captures nusinse flows from over irrigation which provides “in-lieu” recharge benefits
2. Consider pumping quotas on City wells equivalent to marginal opportunity cost or minimum groundwater table levels established at a date no later than project approval
3. Make municipal water connections available for surrounding properties

TRAFFIC/NOISE

This level of density will cause significant traffic issues through your rural neighborhood. (ie people will go around shepard/sunnyside and take the back way home, street improvements will be required)>>>>development must improve roads internal to neighborhood and fowler ave to behymer

ENDANGERED SPECIES

The project site must be evaluated from a “fallow field” based upon current conditions. This site is no longer actively farmed and therefore not a mature orchard. Since being effectively fallowed, the vegetation characteristics of the trees have changed–they are now significantly thinned and are suitable for foraging by the swainson hawk and other raptors.

Furthermore, active, well-documented swainson hawk nests are within a 1/4-mile radius of the proposed project.

No developed utility plan for this area, such high costs for a small area don't make sense
No logical expansion of city services, this is very opportunistic and developer driven. This has significant growth inducing impacts for a relatively small development, these cumulative impacts must be studied and mitigated appropriately.

Prior to completion of environmental review, the developer demolished potentially significant historical resources relating to the former owner, agriculture in the area and farm labor.

Sincerely,

Robert Shuman

George, I'm having trouble logging onto the meeting, so please add this to the public comment on the Spensley property.

With respect to the scope of the EIR, it's my request that the ER make special provision and consideration for the water issues of the Quail run neighborhood just north of the Spensley property.

Jared Callister.

I'll respond to DDW to let them know a new water system is not being created and an amended water supply permit is not needed. This proposed area will be annexed to the City and will require an extension of our existing potable and non-potable systems, not "new" as stated in the NOP.

Paul

Subject: [External] City of Clovis, Shepard North, NOP, Water Supply Permit Needed?

Leon,

I help out the Division of Drinking Water with CEQA for water supply permits. I was reviewing the CEQAnet database and noticed your City has a Notice of Preparation out for a 155 acre development north of your City's limit. The development includes 605 residential units, parkland, and public and private infrastructure.

The Notice of Preparation mentioned the Project site would be served by a new potable and non-potable water distribution system. The posting indicated the proposed water system will be located within the proposed public utilities easements and be connected to existing City mains and will comply with City Master Plans and standards.

The Notice of Preparation can be found here:
https://link.edgepilot.com/s/7aa04f38/lS1CzKpxREyY1McvlPUuaw?u=https://ceqanet.opr.ca.gov/2022050180

Since the NOP referred to a new potable water distribution system and the location is outside
area, I just wanted to confirm this Project would not require an amended water supply permit by your water system or create a new water system.

Thanks for your help with this!

George Gonzalez, MPA, Senior Planner
City of Clovis, Planning Division
1033 Fifth Street
Clovis, CA 93612

Dear Mr. Gonzalez:

NOTICE OF PREPARATION OF AN ENVIRONMENTAL IMPACT REPORT FOR THE SHEPHERD NORTH PROJECT, SCH# 2022050180

The Department of Conservation's (Department) Division of Land Resource Protection (Division) has reviewed the Notice of Preparation of an Environmental Impact Report for the Shepherd North Project (Project). The Division monitors farmland conversion on a statewide basis, provides technical assistance regarding the Williamson Act, and administers various agricultural land conservation programs. We offer the following comments and recommendations with respect to the project's potential impacts on agricultural land and resources.

Project Description

The Project site is north of the City of Clovis limit line at the northeast corner of N. Sunnyside Avenue and E. Shepherd Avenue. The Project site is approximately 155 acres and includes the approximate 77-acre Development Area and the approximate 78-acre Non-Development Area. The Development Area includes the parcels being annexed that will be entitled for subdivision and development of up to 605 residential units, parkland, and public and private infrastructure. The application includes a request for a Sphere of Influence Expansion, General Plan Amendment, Pre-zone, Annexation, Tentative Map, Planned Development Permit, and Residential Site Plan Review. The Non-Development Area includes the parcels being included in the Sphere of Influence (SOI) expansion that will not be entitled for subdivision or development.

Department Comments

The conversion of agricultural land represents a permanent reduction and significant impact to California's agricultural land resources. CEQA requires that all feasible and reasonable mitigation be reviewed and applied to projects. Under CEQA, a lead agency should not approve a project if there are feasible alternatives or feasible mitigation measures available that would lessen the significant effects of the project.

All mitigation measures that are potentially feasible should be included in the project's environmental review. A measure brought to the attention of the lead agency should not be left out unless it is infeasible based on its elements.

Consistent with CEQA Guidelines, the Department recommends the County consider agricultural conservation easements, among other measures, as potential mitigation. (See Cal. Code Regs., tit. 14, § 15370 [mitigation includes "compensating for the impact by replacing or providing substitute resources or environments, including through permanent protection of such resources in the form of conservation easements."])

Mitigation through agricultural easements can take at least two forms: the outright purchase of easements or the donation of mitigation fees to a local, regional, or statewide organization or agency whose purpose includes the acquisition and stewardship of agricultural easements. The conversion of agricultural land should be deemed an impact of at least regional significance. Hence, the search for replacement lands should not be limited strictly to lands within the project's surrounding area.

A helpful source for regional and statewide agricultural mitigation banks is the California Council of Land Trusts. They provide helpful insight into farmland mitigation policies and implementation strategies, including a guidebook with model policies and a model local ordinance. The guidebook can be found at:

California Council of Land Trusts

Of course, the use of conservation easements is only one form of mitigation that should be considered. Any other feasible mitigation measures should also be considered. Indeed, the recent judicial opinion in King and Gardiner Farms, LLC v. County of Kern (2020) 45 Cal.App.5th 814 ("KG Farms") holds that agricultural conservation easements on a 1 to 1 ratio are not alone sufficient to adequately mitigate a project's conversion of agricultural land. KG Farms does not stand for the proposition that agricultural conservation easements are irrelevant as mitigation. Rather, the holding suggests that to the extent they are considered, they may need to be applied at a greater than 1 to 1 ratio, or combined with other forms of mitigation (such as restoration of some land not currently used as farmland).

Conclusion

The Department recommends further discussion of the following issues:

- Type, amount, and location of farmland conversion resulting directly and indirectly from implementation of the proposed project.

- Impacts on any current and future agricultural operations in the vicinity; e.g., land-use conflicts, increases in land values and taxes, loss of agricultural support infrastructure such as processing facilities, etc.
- Incremental impacts leading to cumulative impacts on agricultural land. This would include impacts from the proposed project, as well as impacts from past, current, and likely future projects.
- Proposed mitigation measures for all impacted agricultural lands within the proposed project area.
- Projects compatibility with lands within an agricultural preserve and/or enrolled in a Williamson Act contract.

Thank you for giving us the opportunity to comment on the Notice of Preparation of an Environmental Impact Report for the Shepherd North Project. Please provide this Department with notices of any future hearing dates as well as any staff reports pertaining to this project. If you have any questions regarding our comments, please contact Farl Grundy, Associate Environmental Planner via email at Farl.Grundy@conservation.ca.gov.

Sincerely,

Monique Wilber

County of Fresno

DEPARTMENT OF PUBLIC WORKS AND PLANNING
STEVEN E. WHITE, DIRECTOR

June 2, 2022

George Gonzalez, Senior Planner
Planning Division
City of Clovis
1033 Fifth Street
Clovis, CA 93612

SUBJECT: Notice of Preparation – Shepherd North Project

Dear George Gonzalez:

The County of Fresno appreciates the opportunity to review and comment on the subject project being reviewed by the City of Clovis. Staff's understanding is that the proposed project is proposing a development area including annexed parcels that will be entitled for subdivision and development of up to 605 residential units, parkland, and public and private infrastructure. The application includes a request for a Sphere of Influence Expansion, General Plan Amendment, Pre-zone, Annexation, Tentative Map, Planned Development Permit, and Residential Site Plan Review. The Non-Development Area includes the parcels being included in the Sphere of Influence (SOI) expansion that will not be entitled for subdivision or development.

I am providing the following excerpts of comments provided by our County of Fresno divisions, particularly as it relates to the proposed Shepherd North Project.

Environmental Health:

Recommended Conditions of Approval:

1. If future applicants propose to use and/or store hazardous materials and/or hazardous wastes, they shall meet the requirements set forth in the California Health and Safety Code (HSC), Division 20, Chapter 6.95, and the California Code of Regulations (CCR), Title 22, Division 4.5. Any business that handles a hazardous material or hazardous waste may be required to submit a Hazardous Materials Business Plan pursuant to the California Health and Safety Code (HSC), Division 20, Chapter 6.95, Section 25507 (http://cers.calepa.ca.gov/). Contact the Fresno County Hazmat Compliance Program at (559) 600-3271 for more information.

2. If any underground petroleum storage tank(s) are discovered during construction activities, the applicant/property owner shall apply for and secure an Underground Storage Tank Removal Permit from the Fresno County Department of Public Health, Environmental Health Division. Contact the Fresno County Hazmat Compliance Program at (559) 600-3271 for more information.

3. As a measure to protect groundwater, all water wells (not intended for use) and septic systems within the property shall be properly destroyed by an appropriately licensed contractor. Contact the Fresno County Department of Public Health, Water Surveillance Program at (559) 600-3357 for more information.

4. Appropriate measures should be incorporated into the construction phase of future projects to minimize potentially significant short-term localized noise impacts to noise sensitive receivers caused by the operation of construction equipment. Construction specifications for projects should require that all construction equipment is maintained according to the manufacturers' specifications, and that noise generating construction equipment is equipped with mufflers. In addition, consideration should be given to limiting noise-generating construction activities to daytime hours.

5. Future projects have the potential to expose nearby residents to elevated noise levels. Consideration should be given to conformance with the applicable standards of the Noise Element of the City of Fresno General Plan. Consideration should be given to noise sensitive receivers within the City's Zoning Map.

If you have any further questions regarding this matter, please contact Kevin Tsuda at KTsuda@FresnoCountyCA.gov (559) 600-3271.

<u>Design Division:</u>

1. Due to the projected traffic, a traffic impact study (TIS) should be required to determine the impact to County's roadways. The TIS should also evaluate the roadway condition and geometry for adequacy to accommodate the increased traffic. Please include the County of Fresno on any future TIS routings.

If you have any further questions regarding transportation or design matters, please contact Gloria Hensley at GHensley@FresnoCountyCA.gov or (559) 600-4265.

If you have any questions regarding the information described in this letter, please contact me at MParker@FresnoCountyCA.gov or (559) 600-9669.

Sincerely,

Marissa Parker, Planner
Development Services and Capital Projects Division

RE: Notice of Preparation of a Draft EIR for the Shepherd North Project, Clovis, CA
N/E Shepherd and Sunnyside avenues

Dear Mr. Gonzalez:

The Fresno Irrigation District (FID) has reviewed the Notice of Preparation of a Draft EIR for the proposed Shepherd North Project led by the City of Clovis, APNs: 557-021-19, 20, & 21. The project site is approximately 155-acres and includes an approximate 77-acre Development Area and an approximate 78-acre Non-Development Area. The development area includes parcels that will be annexed and will be entitled for subdivision and development of up to 605 residential units, parkland, and private infrastructure. FID has the following comments:

1. FID does not own, operate, or maintain any facilities located on the subject properties, as shown on the attached FID exhibit map.

2. The proposed development appears to be within the City of Clovis but lies outside FID's boundary line. The parcels are not entitled to water from the Kings River.

3. FID is concerned that the proposed development may negatively impact local groundwater supplies including those areas adjacent to or neighboring the proposed development area. The area was historically agricultural and rural residential. Under current circumstances the project area is experiencing a modest but continuing groundwater overdraft. Should the proposed development result in a significant increase in dependence on groundwater, this deficit will increase. FID recommends the City of Clovis require the proposed development balance anticipated groundwater use with sufficient recharge of imported surface water in order to preclude increasing the area's existing groundwater overdraft problem.

4. California enacted landmark legislation in 2014 known as the Sustainable Groundwater Management Act (SGMA). The act requires the formation of local groundwater sustainability agencies (GSAs) that must assess conditions in their local water basins and adopt locally-based management plans. FID and the City of Clovis are members of the North Kings Groundwater Sustainability Agency which will manage the groundwater basin within the FID service area. This area is completely reliant on groundwater pumping and SGMA will impact all users of groundwater and those who rely on it. The City of Clovis should consider the impacts of the development on the City's ability to comply with requirements of SGMA.

5. It is unclear if the source of water for this development is solely groundwater or a mixture of treated surface water from FID's Enterprise Canal. If treated surface water will be used, the City must acquire additional water from a water purveyor, such as FID for that purpose, so as to not reduce water supplies to or create water supply deficits in other areas of the City. Water supply issues must be resolved before any further "hardening" of the water supply demand is allowed to take place.

6. The City of Clovis and FID have been working to address water supplies issues for development outside of the FID service area. We encourage the City to continue towards finding solutions to minimize the impacts of changes in land uses and to mitigate any existing adverse water supply impacts within the development areas.

7. For informational purpose, FID's Enterprise No. 109 runs northwesterly and crosses Fowler Avenue approximately 1,200 feet southeast of the subject property, Sunnyside Avenue approximately 480 feet south of the subject property, and Shepherd Avenue approximately 580 feet west of the subject property, as shown on the attached FID exhibit map. Should this project include any street and/or utility improvements along Sunnyside Avenue, Shepherd Avenue, or in the vicinity of this facility, FID requires it review and approve all plans.

8. For informational purposes, Fresno Metropolitan Flood Control District's Big Dry Creek No. 150 runs southwesterly and traverse the proposed development, FID recommends reaching out to FMFCD for further comments.

Thank you for submitting the proposed project for our review. We appreciate the opportunity to review and comment on the subject documents for this project. If you have any questions, please feel free to contact Chris Lundeen at (559) 233-7161 extension 7410 or clundeen@fresnoirrigation.com.

Sincerely,

Laurence Kimura, P.E.
Chief Engineer

NOTICE OF PREPARATION

TO: State Clearinghouse
State Responsible Agencies
State Trustee Agencies
Other Public Agencies

Interested Organizations

FROM: George González, MPA | Senior Planner
City of Clovis | Planning Division
1033 Fifth Street
Clovis, CA 93612
559.324.2383
georgeg@cityofclovis.com

SUBJECT: Notice of Preparation – Shepherd North Project

Notice is hereby given that the City of Clovis is the lead agency for the preparation of a project-level Environmental Impact Report (EIR) for the proposed Shepherd North Project (proposed Project), in accordance with the California Environmental Quality Act (CEQA), Section 15050. The EIR will consider potential environmental effects of the proposed project to determine the level of significance of the environmental effect and will analyze these potential effects to the detail necessary to make a determination on the level of significance. The EIR will consider those environmental issues which are raised by responsible agencies, trustee agencies, and members of the public or related agencies during the Notice of Preparation (NOP) process.

We need to know the views of your agency or organization as to the scope and content of the environmental information germane to your agency's statutory responsibilities or of interest to your organization in connection with the proposed project. Specifically, we are requesting the following:

1. If you are a public agency, state whether your agency will be a responsible or trustee agency for the proposed project and list the permits or approvals from your agency that will be required for the project and its future actions;
2. Identify significant environmental effects and mitigation measures that you believe need to be explored in the EIR with supporting discussion of why you believe these effects may be significant;
3. Describe special studies and other information that you believe are necessary for the City to analyze the significant environmental effects, alternatives, and mitigation measures you have identified;
4. For public agencies that provide infrastructure and public services, identify any facilities that must be provided (both on- and off-site) to provide services to the proposed project;
5. Indicate whether a member(s) from your agency would like to attend a scoping workshop/meeting for public agencies to discuss the scope and content of the EIR's environmental information; and
6. Provide the name, title, and telephone number of the contact person from your agency or organization that we can contact regarding your comments.

Due to the time limits mandated by State law, your response must be sent and received by the City of Clovis by the following deadlines:

PROJECT LOCATION

The Project site is directly north of the City of Clovis limit line at the northeast corner of N. Sunnyside Avenue and E. Shepherd Avenue. The Project site is bounded on the north by Perrin Road, on the east by N. Fowler Avenue, on the south by E. Shepherd Avenue, and on the west by N. Sunnyside Avenue. Figures 1 and 2 show the Project's regional location and vicinity. The Project site is in the southwest ¼ of Section 21, Township 12 South, Range 21 East, Mount Diablo Base and Meridian (MDBM). Figure 3 illustrates the Project location on the USGS Clovis, California, 7.5-minute series quadrangle map.

PROJECT SITE DEFINED

The Project site includes several distinct planning boundaries defined below. The following terms are used throughout this document to describe planning area boundaries within the Project site:

- Project Area – includes the whole of the Project site (approximately 155 acres), including the approximate 77-acre Development Area and the approximate 78-acre Non-Development Area.
- Development Area - includes the parcels being annexed that will be entitled for subdivision and development. This will include a Sphere of Influence Expansion, General Plan Amendment, Pre-zone, Annexation, Tentative Map, Planned Development Permit, and Residential Site Plan Review.
- Non-Development Area - includes the parcels being included in the Sphere of Influence (SOI) expansion that will not be entitled for subdivision or development. This includes two separate areas, each described as an Expansion SubArea. The two Expansion SubAreas total 78 acres and are defined as Expansion SubArea North and Expansion SubArea East.

PROJECT SETTING

EXISTING SITE CONDITIONS

The Project site is approximately 155 acres and includes 39 Assessor parcels (APNs). Figure 4 illustrates the APNs.

SITE TOPOGRAPHY

The Project site is relatively flat and is approximately 385 feet above mean sea level.

EXISTING SITE USES

The Development Area primarily contains farmland (orchard), and had three residential dwellings and a warehouse that was removed in approximately 2020. The majority of the Development Area is in active agricultural use (pecan orchards).

There are five agricultural water wells located in the Development Area, two located along the east-west centerline of the area, one located in the southwestern corner of the area, one located in the northwestern corner of the area and one located along the eastern boundary of the Development Area. There are four pole-mounted transformers in the Development Area. Two pole-mounted transformers

orchards, pastures, or other agricultural or open space activities. The allowable maximum density for this land use designation is one dwelling unit per two acres.

Fresno County

Figure 7 identifies the Fresno County land use designations and zoning for the Project site and the surrounding area. The Development Area is designated as Low Density Residential by the County's General Plan Land Use Map and is zoned AL-20 (Limited Agricultural) by the County. The Non-Development Area is designated as Rural Residential by the County's General Plan Land Use Map and is zoned RR (Rural Residential) by the County.

PROJECT GOALS AND OBJECTIVES

Consistent with CEQA Guidelines Section 15124(b), a clear statement of objectives and the underlying purpose of the proposed Project shall be discussed.

PROJECT OBJECTIVES

The principal objective of the proposed Project is the expansion of the City's SOI to include the Project site, and the annexation, approval and subsequent development of the Development Area.

The quantifiable objectives include the development of 605 single family residential units. The quantifiable objectives include the development of open space totaling 4.32 acres, including 1.49 acres of private park and recreational uses. The Project objectives also include the installation of new public and private roadways that will provide pedestrian and vehicular access to the Project site and surrounding community areas, and other improvements, including water supply, storm drainage, sewer facilities and landscaping to serve the residential uses.

The goals of the proposed development are as follows:

- Provide residential housing opportunities that are visually attractive and accommodate the future housing demand in Clovis.
- Establish a mixture of housing types, sizes and densities that collectively provide for local and regional housing demand.
- Provide infrastructure that meets City standards and is integrated with existing and planned facilities and connections.
- Establish a logical phasing plan designed to ensure that each phase of development would include necessary public improvements required to meet City standards.
- Expand the City's Sphere of Influence in order to establish a logical and orderly boundary that promotes the efficient extension of municipal services.

provide pedestrian and vehicular access to the Project site and surrounding community areas, and other improvements, including water supply, storm drainage, sewer facilities and landscaping. Figure 10a, 10b, and 10c illustrate the proposed site plans for the Development Area.

PLANNED DEVELOPMENT PERMIT

The proposed Project includes a Planned Development Permit (PDP) for the Development Area of the Project, which will incorporate a program of enhanced amenities (e.g., additional open space, park improvements and/or trail development). The PDP may allow for modifications to the applicable development standards, such as lot coverage, setbacks and building heights.

ANNEXATION

The proposed Project includes an annexation of three APNs totaling approximately 77 acres. This includes the Development Area.

RESIDENTIAL SITE PLAN REVIEW

The proposed Project includes a Residential Site Plan Review (RSPR) for the Development Area as a condition of a subdivision map implementing provisions of zoning.

SPHERE OF INFLUENCE EXPANSION

The proposed Project includes an amendment of the City's Sphere of Influence (SOI) to include the entirety the approximately 155-acre Project site. The area is currently located in the City's Planning Area, but outside of the City's SOI. The amendment of the City's SOI will require an application and approval by the Fresno Local Agency Formation Commission (LAFCo).

DEVELOPMENT PROJECT CHARACTERISTICS

The proposed Project is primarily a residential development anticipated to provide up to 605 residential units. The Development Project would provide approximately 1.49 acres of private greenspace. Other uses to support and compliment the proposed residential development include public utility infrastructure, public and private roadways, curb/gutters/sidewalks, pedestrian facilities, private parking, street lighting, and street signage.

Development of housing will depend on market conditions and demand. The plan for infrastructure allows for development to occur in phases to respond to the market conditions and demand.

RESIDENTIAL DEVELOPMENT

The proposed Project will provide a variety of housing types and lot sizes that will accommodate a range of housing objectives and buyer needs with a goal to ensure housing for a variety of families and lifestyles. The Development Area will accommodate up to 605 residential units. Specifically, the northern portion of the Development Area would include the development of up to 107 single-family residences with lot sizes ranging from approximately 7,500 square feet to 19,300 square feet. The southern portion of the Development Area would be developed with smaller lot single-family residences, with lot sizes ranging northwest, and ultimately the northeast urban centers. The plant is designed to accommodate future expansion and will ultimately treat 8.4 mgd.

Storm Drainage

The Project site would include construction of a new storm drainage system, which will confirm to the City's standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations. This includes, but not limited to the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. Stormwater throughout the City is collected in FMFCD's basins.

Regulated Public Utilities

Electrical and gas, provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along E. Shepherd Avenue and from existing residential development surrounding the Project site. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Utility improvements would be installed in conjunction with planned street improvements.

ALTERNATIVES

Three alternatives to the proposed Project were developed based on input from City staff. The alternatives that are anticipated to be analyzed in the EIR include the following three alternatives in addition to the proposed Project.

- **No Project (No Build) Alternative**: Under this alternative, development of the Project site would not occur, and the Project site would remain in its current existing condition.
- **Increased Density Alternative:** Under this alternative, the proposed Project would be developed with the same number of units as described in the Project Description, but the density of the residential uses would be increased, reducing the overall footprint of the developed areas and preserving the remaining Development Area for agricultural production.
- **Reduced Sphere of Influence Alternative:** Under this alternative, the proposed Project would exclude the 78-acre SOI Expansion north and east of the Development Area.

NO PROJECT (NO BUILD) ALTERNATIVE

Under the No Project (No Build) Alternative development of the Project site would not occur, and the Project site would remain in its current existing condition. It is noted that the No Project (No Build) Alternative would fail to meet the Project objectives.

INCREASED DENSITY ALTERNATIVE

Under this alternative, the proposed Project would be developed with the same components as described in the Project Description, but density of the residential uses would be increased. Under the Increased Density Alternative, the same number of residential units as the proposed project (607 units) would be constructed within the Development Area. The residential areas would be reduced at increased densities

- Central Valley Regional Water Quality Control Board (CVRWQCB) - Storm Water Pollution Prevention Plan (SWPPP) approval prior to construction activities pursuant to the Clean Water Act;
- San Joaquin Valley Air Pollution Control District (SJVAPCD) - Approval of construction-related air quality permits; and
- Fresno Metropolitan Flood Control District – review of stormwater facilities.

Fresno Metropolitan Flood Control District
Capturing Stormwater since 1956

File 170.908
310. "BY1"
550.30 "BY1"

June 10, 2022

Mr. George Gonzalez, MPA, Senior Planner
City of Clovis, Planning Division
1033 Fifth Street
Clovis, CA 93612

Dear Mr. Gonzalez,

Fresno Metropolitan Flood Control District Comments for
Notice of Preparation of an Environmental Impact Report for
Shepherd North Project
Drainage Area "BY1"

General Comments

This letter is in response to the City's request for comments regarding the Notice of Preparation of an Environmental Impact Report for the Shepherd North Project planning area boundaries "Project Area" and "Development Area". The Fresno Metropolitan Flood Control District (FMFCD) bears responsibility for storm water management within the Fresno-Clovis metropolitan area, including the area of the "Project Area". Within the metropolitan area, storm runoff produced by land development is to be controlled through a system of pipelines and storm drainage retention basins. The community has developed and adopted a Storm Drainage and Flood Control Master Plan. Each property contributes its pro-rata share to the cost of the public drainage system. All properties are required to participate in the community system for everyone. It is this form of participation in the cost and/or construction of the drainage system that will mitigate the impact of development.

The subject "Project Area" shall pay drainage fees pursuant to the Drainage Fee Ordinance prior to approval of any final maps and/or issuance of building permits at the rates in effect at the time of such approval. Please contact FMFCD for a final fee obligation prior to issuance of any construction permits. Should land use densities of existing areas be increased, the property would be subject to a reassessment of drainage fees based on the proposed increased land uses and may include the requirement of additional drainage fees to be paid to offset the increased land use. Each proposed development will be reviewed and assessed upon submittal to FMFCD. Any drainage fees previously paid on a property would be given a credit against any new fee responsibility.

k:\letters\environmental impact report letters\nop eir shepherd north project(by)(dw).docx

Lot coverage must be provided to the District prior to submittal of improvement plans. The final drainage fee will be calculated commensurate with the lot coverage provided by the developer. If the lot coverage indicates a density higher than Master Planned, mitigation may be required. The lot coverage calculated by the District includes the front yard walkway, sidewalk walkway and the rear yard patio equaling an additional 6% of impervious area in addition to the City's typical lot coverage calculation.

The grading of any proposed development within the "Project Area", including public street areas, shall be consistent with the FMFCD Master Plan. Additionally, grading shall not have an adverse impact to major storm conveyance, and to the passage of storm water to the adjacent roadways and existing storm drainage pipelines and inlets. The "Project Area" shall provide the appropriate surface flowage easements or covenants for any portion of the development area that cannot convey storm water to the public right-of-way without crossing private property.

If there are to be storm water discharges from private facilities to the FMFCD's storm drainage system, they shall consist only of storm water runoff and shall be free of solids and debris. Landscape and/or area drains are not allowed to connect directly to FMFCD's facilities.

FMFCD will need to review and approve the final improvement plans for all development (i.e. grading, street improvement and storm drain facilities) within the boundaries of the "Project Area" to insure consistency with the approved Storm Drainage Master Plan.

The Master Plan system has been designed such that during a two-year event flow will not exceed the height of the 6-inch curb. Should wedge curb (4.5 inches height) be used the same criteria shall apply whereby flow remains below the top of curb. Any extensions or pipe size increases due to meeting the requirement listed above shall be at the developer's expense.

A minimum fifteen-foot (15') wide storm drain easement will be required whenever storm drain facilities are located on private property. No encroachments into the easement will be permitted including, but not limited to, foundations, roof overhangs, swimming pools, and trees.

Specific Comments to the Shepherd North Project

The "Development Area" is currently located within FMFCD's adopted Rural Master Plan Drainage Area "BY1", as shown on Exhibit No. 1. The adopted Rural Master Plan drainage system is designed to serve the existing land uses of open space, range/pasture and rural residential housing densities ranging from 0 to 0.7 dwelling unit/acre (du/ac). The existing planned drainage facilities do not have capacity to serve the proposed higher urban density residential land use. The

"Development Area" shall be required to mitigate the impacts of the increased runoff from the proposed higher density residential land use to the adopted rural planned rate. The "Development Area" may either make improvements to the existing pipeline system to provide additional capacity (see Optional Non-Master Plan facilities, not Eligible for Credit, as shown on Exhibit No. 1) or may use some type of onsite permanent peak reducing facility in order to match the adopted Rural Master Plan flow rates and eliminate any adverse impacts on the downstream drainage system. Implementation of the mitigation measures may be deferred until the time of development. However, FMFCD requests that the grading Engineer contact the District as early as possible to review the proposed site grading for verification and acceptance of mitigation design prior to preparing a grading plan.

The construction of the Optional Master Plan Facilities and Optional Non-Master Plan Facilities, as shown on Exhibit No. 1, will provide permanent drainage service to the portion of the "Development Area" located north of Heirloom Avenue. The construction of the Optional Non-Master Plan Facilities, as shown on Exhibit No. 1, will provide permanent drainage service to the portion of the "Development Area" located south of Heirloom Avenue upon construction of facilities by Developer of Tracts 6292 and 6344. If these optional facilities are not constructed, the District recommends temporary facilities until permanent service is available.

The "Development Area" shall not block the historical drainage patterns of existing homes located within the parcels to the east and west side of the "Development Area". The "Development Area" shall verify to the satisfaction of the District that runoff from these areas has the ability to surface drain to adjacent streets or be collected into PER-3, as shown on Exhibit No. 1. Either a stub street, channel, or a combination of both shall be provided for those areas, as shown on Exhibit No. 1.

The "Development Area" must identify what streets will pass the major storm and provide calculations that show structures will have adequate flood protection. Based on historical drainage patterns some of the streets located within the "Development Area" may need to be resized or reconfigured (including but not limited to streets that include traffic calming curbs) to pass larger event storms. District approval is not extended to street configuration. A drainage report indicating the path of the major storm flow and calculations confirming there is adequate protection of finished floors will be necessary.

Perrin Tributaries PER-1 and PER-3 are natural stream courses traversing the "Project Area". These stream courses are shown on the Storm Drainage and Flood Control Master Plan (see Exhibit No. 1). Should the "Development Area" choose to modify or relocate these channels, the developer must contact all agencies having an interest in these channels and comply with their regulations regarding the channels. These agencies may include State of California Fish and

Wildlife, State of California Regional Water Quality Control Board (Section 401 of Clean Water Act), and the U.S. Army Corps of Engineers (USACE) (Section 404 of Clean Water Act). Furthermore, if a USACE Clean Water Act Section 404 permit application package is prepared, FMFCD requests an opportunity to review the application prior to submittal.

These channels must be protected and improved in their current location, or an accepted relocation plan must be provided. The protection and improvement of these channels is necessary to convey upland surface runoff through the "Development Area" without adversely affecting other property owners and to provide safe conveyance through the "Development Area". The plans to retain or relocate these channels must be addressed in a drainage report prepared by the developer's engineer and submitted and acceptable to FMFCD for the project and include a study of any affect to the hydraulic performance of the channel. Adequate easement width for Perrin Tributaries PER-1 and PER-3 shall be dedicated to FMFCD prior to approval of the Final Map. The easements shall be of sufficient width to accommodate the Master Plan flow rate and provide adequate maintenance access. Development within the easement is prohibited. FMFCD does not contemplate public access within the easement.

While FMFCD accepts the channel easements to assure their protection, the maintenance of these channels will remain with the property owner. The easement dedication documents will require reimbursement of costs should FMFCD need to intervene in order to perform maintenance and/or otherwise preserve the channels. FMFCD would prefer that the "Development Area" establish a homeowner's association to maintain the channels, but if that is not feasible, each parcel owner along the channels will be burdened with the maintenance of the channel within their property and fences will not be permitted across the channel. Some thought needs to be put into both private and public channel crossings. Preferably, channel crossings will be kept to a minimum and each crossing will require an encroachment agreement identifying the applicant as responsible for the long-term maintenance and potential removal of the encroachment.

As channel design and construction of Perrin Tributaries PER-1 and PER-3 will affect the lot pattern and configuration, FMFCD will review the work of the developer's engineer to determine easement limits at the time of dedication. The channel design must be completed prior to tentative map approval to ensure the easement areas are known and adequate space is allotted for each channel. It is in the developer's interest to identify the channel design as early as possible so that appropriate lot configurations are selected. The hydraulic study must reflect culverts where roads and driveways cross the channel. Easement areas must be adequate to convey the design flows.

The standard geometry parameters for Perrin Tributaries PER-1 and PER-3 are a minimum 4-foot wide bottom and maximum 2:1 side slope. The channels must be designed and constructed to accommodate the flow rate of 16 cubic feet per second for PER-1 and 10 cubic feet per second for PER-3 as identified in the Master Plan. The channel design must include hydraulic modeling using the HEC-RAS computer program. Channel design and hydraulic study must also consider the attenuation currently provided by the developer's property and not reduce the attenuation or otherwise increase conveyance to downstream properties.

FMFCD will accept the easement dedications for Perrin Tributaries PER-1 and PER-3 following completion of construction, including any mitigation obligations, and acceptance under required permits. Any proposed landscaping within the channel easement shall require (i) review and approval by FMFCD, and (ii) maintenance by the property owner.

A portion of the proposed development is in a Federal Emergency Management Agency (FEMA) Zone "AH" flood zone area requiring additional processing and consideration. The developer shall contact FEMA to obtain their requirements.

The City of Clovis, FMFCD, the County of Fresno, the City of Fresno, and the California State University, Fresno are currently covered as Co-Permittees for Municipal Separate Storm Sewer System (MS4) discharges through National Pollutant Discharge Elimination System (NPDES) General Order No. R5-2016-0040 and NPDES Permit No. CAS0085324 (Storm Water Permit) effective May 17, 2018. The previous Storm Water Permit adopted on May 31, 2013 required the adoption of the Stormwater Quality Management Program (SWQMP) that describes the Storm Water Permit implementation actions and Co-Permittee responsibilities. That SWQMP was approved by the Central Valley Regional Water Quality Control Board on April 17, 2015 and is effective until the adoption of a new SWQMP, which is anticipated within the next two years.

The Storm Water Permit requires that Co-Permittees update their CEQA process to incorporate procedures for considering potential stormwater quality impacts when preparing and reviewing CEQA documents. This requirement is found in Provision D.14 of the 2013 Storm Water Permit and in Section 7: Planning and Land Development Program – PLD 3 – Update CEQA Process. The District has created a guidance document that will meet this Storm Water Permit requirement entitled *Guidance for Addressing Stormwater Quality for CEQA Review*, which has been attached. It is recommended that the CEQA review for this project follow the guidance document.

Specific Comments to the Notice of Preparation - Shepherd North Project

These comments area specific to the Notice of Preparation - Shepherd North Project initiated May 9, 2022 (the individual pages are included, and the sentence has been referenced):

1. Page 7 (Utilities and Planned Infrastructure Improvement): Paragraph for Storm Drainage should also include confirming to FMFCD's standards and requirements.

2. Page 9 (Other Governmental Agency Approvals): FMFCD should be revised to include review and approval of stormwater facilities, grading, and street improvements.

3. FMFCD should considered a responsible agency for the "Project Area". Review and approval shall include storm drain facilities, grading, and street improvement plans.

Thank you for the opportunity to comment. Please keep our office informed on the development of these plans. If you should have any questions or comments, please contact FMFCD at (559) 456-3292.

Sincerely,

Denise Wade
Master Plan Special Projects Manager

and FMFCD's

northwest, and ultimately the northeast urban centers. The plant is designed to accommodate future expansion and will ultimately treat 8.4 mgd.

Storm Drainage

The Project site would include construction of a new storm drainage system, which will confirm to the City's standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations. This includes, but not limited to the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. Stormwater throughout the City is collected in FMFCD's basins.

Regulated Public Utilities

Electrical and gas, provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along E. Shepherd Avenue and from existing residential development surrounding the Project site. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Utility improvements would be installed in conjunction with planned street improvements.

ALTERNATIVES

Three alternatives to the proposed Project were developed based on input from City staff. The alternatives that are anticipated to be analyzed in the EIR include the following three alternatives in addition to the proposed Project.

- **No Project (No Build) Alternative**: Under this alternative, development of the Project site would not occur, and the Project site would remain in its current existing condition.
- **Increased Density Alternative:** Under this alternative, the proposed Project would be developed with the same number of units as described in the Project Description, but the density of the residential uses would be increased, reducing the overall footprint of the developed areas and preserving the remaining Development Area for agricultural production.
- **Reduced Sphere of Influence Alternative:** Under this alternative, the proposed Project would exclude the 78-acre SOI Expansion north and east of the Development Area.

NO PROJECT (NO BUILD) ALTERNATIVE

Under the No Project (No Build) Alternative development of the Project site would not occur, and the Project site would remain in its current existing condition. It is noted that the No Project (No Build) Alternative would fail to meet the Project objectives.

INCREASED DENSITY ALTERNATIVE

Under this alternative, the proposed Project would be developed with the same components as described in the Project Description, but density of the residential uses would be increased. Under the Increased Density Alternative, the same number of residential units as the proposed project (607 units) would be constructed within the Development Area. The residential areas would be reduced at increased densities

- Central Valley Regional Water Quality Control Board (CVRWQCB) - Storm Water Pollution Prevention Plan (SWPPP) approval prior to construction activities pursuant to the Clean Water Act;
- San Joaquin Valley Air Pollution Control District (SJVAPCD) - Approval of construction-related air quality permits; and
- Fresno Metropolitan Flood Control District – review of stormwater facilities.

grading, and street improvements.

and approval

Fresno Metropolitan Flood Control District

Guidance for Addressing Stormwater Quality for CEQA Review

Stormwater Checklist for CEQA Review

a. Potential impact of project construction on stormwater runoff.

Stormwater runoff from construction activities can have a significant impact on water quality. To build on sites with over one acre of disturbed land, property owners must obtain coverage under the California Construction General Permit for Discharges of Stormwater (CGP). The CGP is issued by the State Water Resources Control Board (SWRCB). The CGP requires sites that do not qualify for an erosivity waiver to create a Stormwater Pollution Prevention Plan (SWPPP). The SWPPP is a site-specific plan that is designed to control the discharge of pollutants from the construction site to local storm drains and waterways.

b. Potential impact of project post-construction activity on stormwater runoff.

FMFCD operates the Regional Stormwater Mitigation System, which consists of facilities to handle stormwater runoff and non-stormwater discharges in the FMFCD service area. However, river discharging drainage areas and drainage areas without basin service are subject to FMFCD Policy: Providing for Compliance with Post-Development and Industrial Storm Water Pollution Control Requirements (Policy).

Development and redevelopment projects can result in discharge of pollutants to receiving waters. Pollutants of concern for a project site depend on the following factors:

- Project location;
- Land use and activities that have occurred on the project site in the past;
- Land use and activities that are likely to occur in the future; and
- Receiving water impairments.

As land use activities and site design practices evolve, particularly with increased incorporation of stormwater quality BMPs, characteristic stormwater runoff concentrations and pollutants of concern from various land use types are also likely to change.

Typical Pollutants of Concern and Sources for Post-Development Areas

Pollutant	Potential Sources
Sediment (total suspended solids and turbidity), trash and debris (gross solids and floatables)	Streets, landscaped areas, driveways, roads, construction activities, atmospheric deposition, soil erosion (channels and slopes)

Pesticides and herbicides	Residential lawns and gardens, roadsides, utility right-of-ways, commercial and industrial landscaped areas, soil wash-off
Organic materials/oxygen demanding substances	Residential laws and gardens, commercial landscaping, animal waste
Metals	Automobiles, bridges, atmospheric deposition, industrial areas, soil erosion, metal surfaces, combustion processes
Oil and grease, organics associated with petroleum	Roads, driveways, parking lots, vehicle maintenance areas, gas stations, illicit dumping to storm drains, automobile emissions, and fats, oils, and grease from restaurants
Bacteria and viruses	Lawns, roads, leaking sanitary sewer lines, sanitary sewer cross-connections, animal waste (domestic and wild), septic systems, homeless encampments, sediments/biofilms in storm drain system
Nutrients	Landscape fertilizers, atmospheric deposition, automobile exhaust, soil erosion, animal waste, detergents

Source: Adapted from USEPA, 1999 (Preliminary Data Summary of Urban Storm Water BMPs)

FMFCD’s Post-Development Standards Technical Manual provides guidance for implementing stormwater quality Best Management Practices (BMPs) for drainage areas subject to the Policy, with the intention of improving water quality and mitigating potential water quality impacts from stormwater and non-stormwater discharges. The Post-Development Standards Technical Manual addresses the following objectives and goals:

- Minimize impervious surfaces and directly connect impervious surfaces in areas of new development and redevelopment, and where feasible, to maximize on-site infiltration of stormwater runoff;
- Implement pollution prevention methods supplemented by pollutant source controls and treatment, and where practical, use strategies that control the sources of pollutants or constituents (i.e., where water initially meets the ground) to minimize the transport of runoff and pollutants offsite and into MS4s;
- Preserve, and where possible create or restore, areas that provide important water quality benefits, such as riparian corridors, wetlands, or buffer zones
- Limit disturbances of natural water bodies and natural drainage systems by development, including roads, highways, and bridges;
- Identify and avoid development in areas that are particularly susceptible to erosion and sediment loss or establish guidance that protects areas from erosion and sediment loss;
- Implement source and structural controls as necessary and appropriate to protect downstream receiving water quality from increased pollutant loadings and flows (hydromodification concepts) from new development and significant redevelopment;

- Control the post-development peak stormwater runoff discharge rates and velocities to maintain or reduce pre-development downstream erosion and to protect downstream habitat; and
- Consider integration of Low Impact Development (LID) principles into project design.

The Post-Development Standards Technical Manual describes the stormwater management requirements for Priority Projects, which are identified as meeting one or more of the following and discharge to the San Joaquin River or do not have basin service:

- Home subdivisions of 10 housing units or more;
- Commercial developments greater than 100,000 square feet;
- Automotive repair shops;
- Restaurants;
- Parking lots 5,000 square feet or greater with 25 or more parking spaces and potentially exposed to urban runoff;
- Streets and roads;
- Retail gasoline outlets (RGOs); and
- Significant redevelopment projects, which are developments that result in creation or addition of at least 5,000 square feet of impervious surface on an already developed site. Significant redevelopment includes, but is not limited to, expansion of a building footprint or addition or replacement of a structure, structural developing including an increase in gross floor area and/or exterior construction or remodeling, replacement of impervious surface that is not part of a routine maintenance activity, and land disturbing activities related with structural or impervious surfaces. Where significant redevelopment results in an increase of less than 50 percent of the impervious surfaces of a previously existing development and the existing development was not subject to Post-Construction Standards, only the proposed alteration must meet the requirements of the Post-Development Standards Technical Manual.

All Priority Projects must mitigate the Stormwater Quality Design Volume (SWQDV) or Stormwater Quality Design Flow (SWQDF) through LID- or treatment-based stormwater quality BMPs or a combination thereof.

For new development or significant redevelopment projects for restaurants with less than 5,000 square feet, the project applicant must meet all the requirements of the Post-Development Standards Technical Manual except for mitigating the SWQDV or SWQDF and implementing stormwater quality BMPs.

The Post-Development Standards Technical Manual can be found on FMFCD's website here:

http://www.fresnofloodcontrol.org/wp-content/uploads/2014/11/Post-Development-Standards-Technical-Manual.pdf

c. Potential for discharge of stormwater from areas from material storage, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work areas.

Development projects may create potential impacts to stormwater from non-stormwater discharge from areas with material storage, vehicle or equipment fueling, vehicle or equipment maintenance (including washing), waste handling, hazardous materials handling or storage, delivery areas or loading docks, or other outdoor work area.

Some materials, such as those containing heavy metals or toxic compounds, are of more concern than other materials. Toxic and hazardous materials must be prevented from coming in contact with stormwater runoff. Non-toxic or non-hazardous materials, such as debris and sediment, can also have significant impacts on receiving waters. Contact between non-toxic or non-hazardous materials and stormwater runoff should be limited, and such materials prevented from being discharged with stormwater runoff. To help mitigate these potential impacts, BMPs should be included to prevent discharges from leaving the property.

Refer to FMFCD Post-Development Standards Technical Manual for more information or go to http://water.epa.gov/polwaste/nps/urban.cfm.

d. Potential for discharge of stormwater to impact the beneficial uses of the receiving waters or areas that provide water quality benefits.

Identify receiving waters and describe activities that may impact the beneficial uses of the receiving waters or that project water quality benefits. Project that can impact beneficial uses or receiving waters may be mitigated by implementation of the FMFCD Post-Development Standards Technical Manual.

e. Potential for the discharge of stormwater to cause significant harm on the biological integrity of the water ways and water bodies.

Conservation of natural areas, soils, and vegetation helps to retain numerous functions of pre-development hydrology, including rainfall interception, infiltration, and evapotranspiration. Each project site possesses unique topographic, hydrologic, and vegetative features, some of which are more suitable for development than others. Sensitive areas, such as streams and their buffers, floodplains, wetlands, steep slopes, and highly-permeable soils, should be protected and/or restored. Slopes can be a major source of sediment and should be properly protected and stabilized. Locating development in less sensitive areas of a project site and conserving naturally vegetated areas can minimize environmental impacts from stormwater runoff.

The evaluation of a project's effect on sensitive natural communities should encompass aquatic and wetland habitats. Consider "aquatic and wetland habitat" as examples of sensitive habitat.

f. Potential for significant changes in the flow velocity or volume of stormwater runoff that can cause environmental harm.

The evaluation of a project's effect on drainage patterns should refer to the FMFCD's Storm Drainage and Flood Control Master Plan and have their project reviewed by FMFCD to assess the significance of altering existing drainage patterns and to develop any mitigation measures in addition to our stormwater mitigation system. The evaluation should also consider any potential for streambed or bank erosion downstream from the project.

g. Potential for significant increases in erosion of the project site or surrounding areas.

The evaluation of a project's effect on drainage patterns should refer to the FMFCD's Storm Drainage and Flood Control Master Plan and have their project reviewed by FMFCD to assess the significance of altering existing drainage patterns and to develop any mitigation measures in addition to our stormwater mitigation system. The evaluation should also consider any potential for streambed or bank erosion downstream from the project.

FRE-168-R7.805
Notice of Preparation of an EIR
Shepherd North Project
https://ld-igr-gts.dot.ca.gov/district/6/report/26417

SENT VIA EMAIL

George Gonzalez, Senior Planner
Planning and Development Services Department
City of Clovis
1033 Fifth Street
Clovis, CA 93612

Dear Mr. Gonzalez:

Thank you for the opportunity to review the Notice of Preparation (NOP) of a Draft Environmental Impact Report for the Shepherd North Project. The project proposes to develop approximately 155 acres of land for the construction of 605 single-family residential units and parkland that is currently outside the City of Clovis' city limits. Approximately 2 miles north of the State Route (SR) 168 and Fowler Avenue interchange, the project is located on the northwest quadrant of Shepherd and Fowler Avenue with the project being bounded on the north by Perrin Road, on the east by Fowler Avenue, on the south by Shepherd Avenue, and on the west by Sunnyside Avenue.

Additional subsequent actions and approvals from the City include a General Plan Amendment, Residential Site Plan Review, Vesting Tentative Maps, and other permits and annexation requests.

The mission of Caltrans is to provide a safe and reliable transportation network that serves all people and respects the environment. To ensure a safe and efficient transportation system, we encourage early consultation and coordination with local jurisdictions and project proponents on all development projects that utilize the multimodal transportation networks

Caltrans provides the following comments consistent with the State's smart mobility goals that support a vibrant economy and sustainable communities:

1. Caltrans requests that prior to initiating the Transportation section of the Draft EIR, Caltrans be provided an opportunity to provide comments on the scope of work. If a kick-off meeting for the development of the Draft EIR is planned to be held by the City, Caltrans requests to be included in this meeting

2. Given the proposed number of single-family housing units and proximity to State Route facilities, the proposed project could have potential impacts on state highway facilities. Caltrans recommends that a transportation impact study (TIS) including a Vehicle miles traveled (VMT) analysis be conducted and the scope of the study should include interchanges of SR 168 at Herndon Avenue and Fowler Avenue, and the SR 168/Shepherd Avenue intersection.

3. Caltrans requests that the Draft EIR be submitted for review once completed and circulated by the City.

4. Caltrans recommends the project proponents consider working with the City to convert a portion of the planned residential units to affordable housing units.

5. It is recommended that the City consider a multimodal transportation system (such as bicycle and pedestrian facilities as well as public transportation) to provide connectivity of modes between the residential uses and commercial/retail uses to reduce VMT impacts from the project.

6. Caltrans recommends the City consider creating a VMT Mitigation Impact Fee to help reduce potential impacts on the State Highway System.

7. Alternative transportation policies should be applied to the development. An assessment of multimodal facilities should be conducted to develop an integrated multimodal transportation system to serve and help alleviate traffic congestion resulting from the project and related development in the area of the City. The assessment should include the following:

    a. Pedestrian walkways should not only be limited to the project's internal connectivity but be connected to existing walkways and transit facilities outside the project area.

    b. The project should consider coordinating connections to local and regional bicycle pathways to encourage the use of bicycles for commuter and recreational purposes.

    c. If transit is not available within 1/4-mile of the project area, transit should be extended to provide services to high activity centers of the project.

8. As part of the statewide effort to reduce greenhouse gas emissions, Caltrans recommends the project proponent consider the installation of public Level 2 Electric Vehicle (EV) and DC Fast Charging EV charging stations.

9. Active Transportation Plans and Smart Growth efforts support the state's 2050 Climate goals. Caltrans supports reducing VMT and GHG emissions in ways that increase the likelihood people will use and benefit from a multimodal transportation network.

If you have any other questions, please call or email Christopher Xiong at (559) 908-7064 or Christopher.Xiong@dot.ca.gov.

Sincerely,

DAVID PADILLA, Branch Chief
Transportation Planning – North

San Joaquin Valley
AIR POLLUTION CONTROL DISTRICT

HEALTHY AIR LIVING™

June 10, 2022

George Gonzalez
City of Clovis
Planning Division
1033 Fifth Street
Clovis, CA, 93612

Project: Notice of Preparation-Shepherd North Project

District CEQA Reference No: 20220614

Dear Mr. Gonzalez:

The San Joaquin Valley Air Pollution Control District (District) has reviewed the Notice of Preparation (NOP) from the City of Clovis for the Shepherd North Project. Per the NOP, the project consists of the development of up to 605 residential units, parkland, and public and private infrastructure (Project). The Project site is bounded to the north by Perrin Road, on the east by North Fowler Avenue, on the south by East Shepherd Avenue, and on the west by North Sunnyside Avenue, in Clovis, CA.

The District offers the following comments regarding the Project:

1) <u>Project Related Emissions</u>

At the federal level under the National Ambient Air Quality Standards (NAAQS), the District is designated as extreme nonattainment for the 8-hour ozone standards and serious nonattainment for the particulate matter less than 2.5 microns in size (PM2.5) standards. At the state level under California Ambient Air Quality Standards (CAAQS), the District is designated as nonattainment for the 8-hour ozone, PM10, PM2.5 standards.

The District's initial review of the Project concludes that emissions resulting from construction and/or operation of the Project may exceed any of the following significance thresholds as identified in the District's Guidance for Assessing and Mitigating Air Quality Impacts: https://www.valleyair.org/transportation/GAMAQI.pdf. The District recommends that a more detailed preliminary review of the Project be conducted for the Project's construction and operational emissions.

Samir Sheikh
Executive Director/Air Pollution Control Officer

www.valleyair.org www.healthyairliving.com

1a) Construction Emissions

The District recommends, to reduce impacts from construction-related diesel exhaust emissions, the Project should utilize the cleanest available off-road construction equipment, including the latest tier equipment.

1b) Operational Emissions

Operational (ongoing) air emissions from mobile sources and stationary sources should be analyzed separately. For reference, the District's significance thresholds are identified in the District's Guidance for Assessing and Mitigating Air Quality Impacts: https://www.valleyair.org/transportation/GAMAQI.pdf.

Recommended Mitigation Measure: At a minimum, project related impacts on air quality should be reduced to levels of significance through incorporation of design elements such as the use of cleaner Heavy Heavy-Duty (HHD) trucks and vehicles, measures that reduce Vehicle Miles Traveled (VMTs), and measures that increase energy efficiency. More information on transportation mitigation measures can be found at: http://www.valleyair.org/transportation/Mitigation-Measures.pdf.

1c) Recommended Model for Quantifying Air Emissions

Project-related criteria pollutant emissions from construction and operational sources should be identified and quantified. Emissions analysis should be performed using the California Emission Estimator Model (CalEEMod), which uses the most recent CARB-approved version of relevant emissions models and emission factors. CalEEMod is available to the public and can be downloaded from the CalEEMod website at: www.caleemod.com.

2) Health Risk Screening/Assessment

The City should evaluate the risk associated with the Project for sensitive receptors (residences, businesses, hospitals, day-care facilities, health care facilities, etc.) in the area and mitigate any potentially significant risk to help limit exposure of sensitive receptors to emissions.

To determine potential health impacts on surrounding receptors (residences, businesses, hospitals, day-care facilities, health care facilities, etc.) a Prioritization and/or a Health Risk Assessment (HRA) should be performed for the Project. These health risk determinations should quantify and characterize potential Toxic Air Contaminants (TACs) identified by the Office of Environmental Health Hazard Assessment/California Air Resources Board (OEHHA/CARB) that pose a present or potential hazard to human health.

Health risk analyses should include all potential air emissions from the project, which include emissions from construction of the project, including multi-year construction, as well as ongoing operational activities of the project. Note, two common sources of TACs can be attributed to diesel exhaust emitted from heavy-duty off-road earth moving equipment during construction, and from ongoing operation of heavy-duty on-road trucks.

Prioritization (Screening Health Risk Assessment):
A "Prioritization" is the recommended method for a conservative screening-level health risk assessment. The Prioritization should be performed using the California Air Pollution Control Officers Association's (CAPCOA) methodology.

The District recommends that a more refined analysis, in the form of an HRA, be performed for any project resulting in a Prioritization score of 10 or greater. This is because the prioritization results are a conservative health risk representation, while the detailed HRA provides a more accurate health risk evaluation.

To assist land use agencies and project proponents with Prioritization analyses, the District has created a prioritization calculator based on the aforementioned CAPCOA guidelines, which can be found here:
http://www.valleyair.org/busind/pto/emission_factors/Criteria/Toxics/Utilities/PRIORITIZATION-CALCULATOR.xls

Health Risk Assessment:
Prior to performing an HRA, it is strongly recommended that land use agencies/ project proponents develop and submit for District review a health risk modeling protocol that outlines the sources and methodologies that will be used to perform the HRA. This step will ensure all components are addressed when performing the HRA.

A development project would be considered to have a potentially significant health risk if the HRA demonstrates that the project-related health impacts would exceed the District's significance threshold of 20 in a million for carcinogenic risk, or 1.0 for either the Acute or Chronic Hazard Indices.

A project with a significant health risk would trigger all feasible mitigation measures. The District strongly recommends that development projects that result in a significant health risk not be approved by the land use agency.

The District is available to review HRA protocols and analyses. For HRA submittals please provide the following information electronically to the District for review:

- HRA (AERMOD) modeling files
- HARP2 files

- Summary of emissions source locations, emissions rates, and emission factor calculations and methodologies.

For assistance, please contact the District's Technical Services Department by:

- E-Mailing inquiries to: hramodeler@valleyair.org
- Calling (559) 230-5900

Recommended Measure: Development projects resulting in TAC emissions should be located an adequate distance from residential areas and other sensitive receptors in accordance to CARB's Air Quality and Land Use Handbook: A Community Health Perspective located at https://ww3.arb.ca.gov/ch/handbook.pdf.

3) Ambient Air Quality Analysis

An Ambient Air Quality Analysis (AAQA) uses air dispersion modeling to determine if emissions increases from a project will cause or contribute to a violation of State or National Ambient Air Quality Standards. The District recommends an AAQA be performed for the Project if emissions exceed 100 pounds per day of any pollutant.

An acceptable analysis would include emissions from both project-specific permitted and non-permitted equipment and activities. The District recommends consultation with District staff to determine the appropriate model and input data to use in the analysis.

Specific information for assessing significance, including screening tools and modeling guidance, is available online at the District's website: www.valleyair.org/ceqa.

4) Voluntary Emission Reduction Agreement

Criterial pollutant emissions may result in emissions exceeding the District's significance thresholds, potentially resulting in a significant impact on air quality. When a project is expected to have a significant impact, the District recommends the EIR also include a discussion on the feasibility of implementing a Voluntary Emission Reduction Agreement (VERA) for this Project.

A VERA is a mitigation measure by which the project proponent provides pound-for-pound mitigation of emissions increases through a process that develops, funds, and implements emission reduction projects, with the District serving a role of administrator of the emissions reduction projects and verifier of the successful mitigation effort. To implement a VERA, the project proponent and the District enter into a contractual agreement in which the project proponent agrees to mitigate project specific emissions by providing funds for the District's incentives programs. The funds are disbursed by the District in the form of grants for projects that achieve emission reductions. Thus, project-related impacts on air quality can be mitigated. Types of emission reduction projects that have been funded in the past include electrification of stationary internal combustion engines (such as agricultural irrigation pumps), replacing old heavy-duty trucks with new, cleaner, more efficient heavy-duty trucks, and replacement of old farm tractors.

In implementing a VERA, the District verifies the actual emission reductions that have been achieved as a result of completed grant contracts, monitors the emission reduction projects, and ensures the enforceability of achieved reductions. After the project is mitigated, the District certifies to the Lead Agency that the mitigation is completed, providing the Lead Agency with an enforceable mitigation measure demonstrating that project-related emissions have been mitigated. To assist the Lead Agency and project proponent in ensuring that the environmental document is compliant with CEQA, the District recommends the environmental document includes an assessment of the feasibility of implementing a VERA.

5) Vegetative Barriers and Urban Greening

The District suggests the City consider the feasibility of incorporating vegetative barriers and urban greening as a measure to further reduce air pollution exposure on sensitive receptors (e.g., residential units).

While various emission control techniques and programs exist to reduce air quality emissions from mobile and stationary sources, vegetative barriers have been shown to be an additional measure to potentially reduce a population’s exposure to air pollution through the interception of airborne particles and the update of gaseous pollutants. Examples of vegetative barriers include, but are not limited to the following: trees, bushes, shrubs, or a mix of these. Generally, a higher and thicker vegetative barrier with full coverage will result in greater reductions in downwind pollutant concentrations. In the same manner, urban greening is also a way to help improve air quality and public health in addition to enhancing the overall beautification of a community with drought tolerant, low-maintenance greenery.

6) Clean Lawn and Garden Equipment in the Community

Since the Project consists of residential development, gas-powered residential lawn and garden equipment have the potential to result in an increase of NOx and PM2.5 emissions. Utilizing electric lawn care equipment can provide residents with immediate economic, environmental, and health benefits. The District recommends the Project proponent consider the District’s Clean Green Yard Machines (CGYM) program which provides incentive funding for replacement of existing gas powered lawn and garden equipment. More information on the District CGYM program and funding can be found at: http://www.valleyair.org/grants/cgym.htm
and http://valleyair.org/grants/cgym-commercial.htm.

7) District Rules and Regulations

The District issues permits for many types of air pollution sources, and regulates some activities that do not require permits. A project subject to District rules and regulations would reduce its impacts on air quality through compliance with the District's regulatory framework. In general, a regulation is a collection of individual rules, each of which deals with a specific topic. As an example, Regulation II (Permits) includes District Rule 2010 (Permits Required), Rule 2201 (New and Modified Stationary Source Review), Rule 2520 (Federally Mandated Operating Permits), and several other rules pertaining to District permitting requirements and processes.

The list of rules below is neither exhaustive nor exclusive. Current District rules can be found online at: www.valleyair.org/rules/1ruleslist.htm. To identify other District rules or regulations that apply to future projects, or to obtain information about District permit requirements, the project proponents are strongly encouraged to contact the District's Small Business Assistance (SBA) Office at (559) 230-5888.

7a) District Rules 2010 and 2201 - Air Quality Permitting for Stationary Sources

Stationary Source emissions include any building, structure, facility, or installation which emits or may emit any affected pollutant directly or as a fugitive emission. District Rule 2010 (Permits Required) requires operators of emission sources to obtain an Authority to Construct (ATC) and Permit to Operate (PTO) from the District. District Rule 2201 (New and Modified Stationary Source Review) requires that new and modified stationary sources of emissions mitigate their emissions using Best Available Control Technology (BACT).

This Project may be subject to District Rule 2010 (Permits Required) and Rule 2201 (New and Modified Stationary Source Review) and may require District permits. Prior to construction, the Project proponent should submit to the District an application for an ATC. For further information or assistance, the project proponent may contact the District's SBA Office at (559) 230-5888.

7b) District Rule 9510 - Indirect Source Review

The purpose of District Rule 9510 is to reduce the growth in both NOx and PM emissions associated with development and transportation projects from mobile and area sources; specifically, the emissions associated with the construction and subsequent operation of development projects. The Rule requires developers to mitigate their NOx and PM emissions by incorporating clean air design elements into their projects. Should the proposed development project clean air design elements be insufficient to meet the required emission reductions, developers must pay a fee that ultimately funds incentive projects to achieve off-site emissions reductions.

The Project is subject to District Rule 9510 when it receives a project-level discretionary approval from a public agency and will equal or exceed 50 units of residential.

When subject to the rule, an Air Impact Assessment (AIA) application is required no later than applying for project-level approval from a public agency. In this case, if not already done, please inform the project proponent to immediately submit an AIA application to the District to comply with District Rule 9510.

An AIA application is required and the District recommends that demonstration of compliance with District Rule 9510, before issuance of the first building permit, be made a condition of Project approval.
Information about how to comply with District Rule 9510 can be found online at: http://www.valleyair.org/ISR/ISRHome.htm.

The AIA application form can be found online at:
http://www.valleyair.org/ISR/ISRFormsAndApplications.htm.

District staff is available to provide assistance and can be reached by phone at (559) 230-5900 or by email at ISR@valleyair.org.

7c) District Rule 4002 (National Emissions Standards for Hazardous Air Pollutants)

In the event an existing building will be renovated, partially demolished or removed, the Project may be subject to District Rule 4002. This rule requires a thorough inspection for asbestos to be conducted before any regulated facility is demolished or renovated. Information on how to comply with District Rule 4002 can be found online at:
http://www.valleyair.org/busind/comply/asbestosbultn.htm.

7d) District Regulation VIII (Fugitive PM10 Prohibitions)

The project proponent may be required to submit a Construction Notification Form or submit and receive approval of a Dust Control Plan prior to commencing any earthmoving activities as described in Regulation VIII, specifically Rule 8021 – *Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities.*

Should the project result in at least 1-acre in size, the project proponent shall provide written notification to the District at least 48 hours prior to the project proponents intent to commence any earthmoving activities pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). Also, should the project result in the disturbance of 5-acres or more, or will include moving, depositing, or relocating more than 2,500 cubic yards per day of bulk materials, the project proponent shall submit to the District a Dust Control Plan pursuant to District Rule 8021 (Construction, Demolition, Excavation, Extraction, and Other Earthmoving Activities). For additional information regarding the written notification or Dust Control Plan requirements, please contact District Compliance staff at (559) 230-5950.

The application for both the Construction Notification and Dust Control Plan can be found online at:
https://www.valleyair.org/busind/comply/PM10/forms/DCP-Form.docx

Information about District Regulation VIII can be found online at:
http://www.valleyair.org/busind/comply/pm10/compliance_pm10.htm

7e) District Rule 4901 - Wood Burning Fireplaces and Heaters

The purpose of this rule is to limit emissions of carbon monoxide and particulate matter from wood burning fireplaces, wood burning heaters, and outdoor wood burning devices. This rule establishes limitations on the installation of new wood burning fireplaces and wood burning heaters. Specifically, at elevations below 3,000 feet in areas with natural gas service, no person shall install a wood burning fireplace, low mass fireplace, masonry heater, or wood burning heater.

Information about District Rule 4901 can be found online at:
http://valleyair.org/rule4901/

7f) Other District Rules and Regulations

The Project may also be subject to the following District rules: Rule 4102 (Nuisance), Rule 4601 (Architectural Coatings), and Rule 4641 (Cutback, Slow Cure, and Emulsified Asphalt, Paving and Maintenance Operations).

8) District Comment Letter

The District recommends that a copy of the District's comments be provided to the Project proponent.

If you have any questions or require further information, please contact Matt Crow by e-mail at Matt.Crow@valleyair.org or by phone at (559) 230-5931.

Sincerely,

Brian Clements
Director of Permit Services

For: Mark Montelongo
Program Manager

Re: Tract 6205 – Agricultural Land Evaluation

Dear Mr. Gonzalez:

I have been for several years responsible for managing the former Cal-Pecan orchard located at the northeast corner of Sunnyside and Shepherd Avenues, near Clovis, CA, on behalf of the current owner, Great Big Land, LP and I have been asked to provide a status of the agricultural viability of this property. Essentially, this property has proven to no longer be economically viable for continued irrigated agricultural production.

First and foremost, continued commercial agricultural production is not economically viable on this property because it is located entirely north and east of the Enterprise Canal and therefore *outside* of the nearby Fresno Irrigation District boundary. It is therefore not eligible to receive deliveries of surface water from any irrigation district. This is an entirely different situation from the many other properties located in the nearby Heritage Grove Community Plan area in the City of Clovis that are located on the west side of the Enterprise Canal and continue to receive deliveries of surface water to support agricultural production. Recent SIGMA regulatory changes that now severely limit groundwater pumping has constrained the ability of any agricultural properties located outside of an irrigation district to support intensive agricultural uses that require regular and timely irrigation; further, groundwater pumping on this property had already proven to be unpredictable and unreliable in recent years as available water from the aquifer under the property had been highly variable and provided an unreliable supply. In fact, as we made every effort to continue irrigating the trees to at least keep them alive last summer, the wells on the property went entirely dry and caused the pumps to burn out. The existing pecan trees suffered tremendous damage without available irrigation water and it resulted in large-scale tree mortality.

Second, as a result of implementation of recent SIGMA regulatory changes, virtually all agricultural lending banks and institutions have recently changed their lending requirements to now demand availability of two sources of water (groundwater and surface water) as a condition for continued lending. Unfortunately, this property cannot meet the new lending requirement because it is located outside of an irrigation district, so this property is no longer eligible to obtain agricultural loans to support commercial agricultural operations.

Third, this property has proven to be not economically viable because the soil types and soil substructure varies greatly on the properties and much is not conducive to produce high agricultural yields. Specifically, cemented silty sand, clayey sand, and silty sand with clay, locally referred to as "hardpan" is encountered below 2 feet across much of the property. This cementation retards the free percolation of surface water into the soil stratum below the hardpan, frequently resulting in a temporary perched water table condition at or near the ground surface. This extensive hardpan layer that results in a temporary perched water table condition at or near the ground surface is prohibitive to economically viable agricultural yields.

Fourth, proximity of the properties to existing urban development has unfortunately added great further negativity and stress to the economic viability of agricultural production at this property. The nearby urban interface has greatly increased vandalism, theft and harassment costs in recent years. This vandalism, theft and harassment became particularly troublesome last summer when neighbors would routinely shut-off irrigation pumps during the night and the valves in the orchard rows that are necessary to regulate pressure to operate the system were stolen. Equipment vandalism and theft occurred regularly and continued agricultural operations are now virtually impossible.

For these reasons, this property is simply no longer viable for commercial agricultural production.

Thank you.

Jeffrey B. Harris
Ranch Manager and Chief Operating Officer

APPENDIX C.1

CalEEMod Modeling Results

AGENDA ITEM NO. 6.

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Not Applied

Clovis Shepherd North

Fresno County, Annual

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
City Park	4.32	Acre	5.54	188,179.20	0
Single Family Housing	605.00	Dwelling Unit	71.96	1,089,000.00	1730

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	2.2	**Precipitation Freq (Days)**	45
Climate Zone	3			**Operational Year**	2028
Utility Company	Pacific Gas and Electric Company				
CO2 Intensity (lb/MWhr)	203.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics - Operational year is projected to be year 2028, consistent with the Transportation Impact Analysis prepared by LSA.

Land Use - Project includes 605 single-family dwelling units. Development area includes 77.5 acres of development area. 4.32 acres are open space; the remaining acreage is single-family residential.

Construction Phase - No demolition phase. Building construction phase shortened from CalEEMod default, to reflect estimated op. year of 2028. Site Prep and Grading phases were unchanged; paving and arch. coating phases same length as default.

Grading - Site is relatively flat. Soil assumed to be balanced on-site.

Architectural Coating - SJVAPCD Rule 4601 identifies that residential interior and exterior coatings have a VOC content of no greater than 50 g/L.

Vehicle Trips - TIA (LSA, 2023) identifies 5,705 daily trips, equiv. to 9.43 trips/du/day. TIA also identifies 33,049 total VMT, which is equiv. to 54.62645 VMT/day/du. 54.62645 VMT/du/day divided by 9.43 trips/du/day equals 5.792989 VMT per trip (i.e. trip length).

Woodstoves - No hearths.

On-road Mobile (Operational) Energy Usage

Unmitigated:

Step 1:

Therefore:

Average Daily VMT:

29,268 Source: CalEEMod Output File (10,682,990.9 annual VMT divided by 365 days/year)

Step 2:

Given:

Fleet Mix (CalEEMod Output)

LDA	LDT1	LDT2	MDV	LHD1	LHD2	MHD	HHD	OBUS	UBUS	MCY	SBUS	MH
53.5430%	5.3975%	17.5864%	14.0525%	2.2799%	0.6183%	1.4960%	2.2785%	0.0688%	0.0282%	2.2547%	0.1379%	0.2584%

And:

Gasoline MPG Factors for each Vehicle Class - Year 2028 (EMFAC2021 Output)

LDA	LDT1	LDT2	MDV	MCY	MH	OBUS
32.0911421	26.37344	26.20609	20.98068287	41.97622752	4.414233958	4.911968

Diesel MPG Factors for each Vehicle Class - Year 2028 (EMFAC2021 Output)

LHD1	LHD2	MHD	HHD	UBUS	SBUS
15.9593774	13.42102	8.939233	5.773599046	9.095423562	8.421421355

Therefore:

Weighted Average MPG Factors

Gasoline: **29.1** Diesel: **10.6**

Step 3:

Therefore:

935 daily gallons of gasoline **190 daily gallons of diesel**

or

341,321 annual gallons of gasoline **69,484 annual gallons of diesel**

Off-road Mobile (Construction) Energy Usage

Note: For the sake of simplicity, and as a conservative estimation, it was assumed that all off-road vehicles use diesel fuel as an energy source.
Demolition (if applicable), Site preparation and grading off-road mobile vehicle on-site gallons of fuel are calculated below.

Given Factor:	**192.4**	**metric tons**	**CO2**	**(provided in CalEEMod Output File)**
Conversion Factor:	2204.6262	pounds	per metric ton	
Intermediate Result:	**424,206**	**pounds**	**CO2**	
Conversion Factor:	22.38	pounds	CO2 per 1 gallon of diesel fuel	Source: U.S. EIA, 2016
Final Result:	**18,955**	**gallons**	**diesel fuel**	http://www.eia.gov/tools/faqs/faq.cfm?id=307&t=11

Mitigated Onsite Scenario	Total CO2 (MT/yr) (provided in CalEEMod Output File)
Site Preparation - 2023	101.1635
Grading - 2023	192.42

On-road Mobile (Construction) Energy Usage - Site Preparation

Step 1: **Total Daily Worker Trips (CalEEMod Output)**

18

Worker Trip Length (miles) (CalEEMod Output)

10.8

Therefore:

Average Worker Daily VMT:

194

Step 2: Given:

Assumed Fleet Mix for Workers (Percentage mix is provided on Appendix A: Calculation Details for CalEEMOD p. 15)

LDA	LDT1	LDT2
0.5	0.25	0.25

And:

Gasoline MPG Factors for each Vehicle Class - Year 2023 (EMFAC2021 Output)

LDA	LDT1	LDT2
28.992502	24.00704	23.25365

Therefore:

Weighted Average Worker MPG Factor

26.3

Step 3: **Therefore:**

7.4 Worker daily gallons of gasoline

Step 4: 60 **# of Days (CalEEMod Output)**

Therefore:

Result: **443** **Total gallons of gasoline**

On-road Mobile (Construction) Energy Usage - Grading

Step 1: **Total Daily Worker Trips (CalEEMod Output)**

20

Worker Trip Length (miles) (CalEEMod Output)

10.8

Therefore:

Average Worker Daily VMT:

216

Step 2: Given:

Assumed Fleet Mix for Workers (Percentage mix is provided on Appendix A: Calculation Details for CalEEMOD p. 15)

LDA	LDT1	LDT2
0.5	0.25	0.25

And:

Gasoline MPG Factors for each Vehicle Class - Year 2023 (EMFAC2021 Output)

LDA	LDT1	LDT2
28.992502	24.007041	23.253655

Therefore:

Weighted Average Worker MPG Factor

26.3

Step 3: **Therefore:**

8.2 **Worker daily gallons of gasoline**

Step 4: 155 **# of Days (CalEEMod Output)**

Therefore:

Result: **1,272** **Total gallons of gasoline**

On-road Mobile (Construction) Energy Usage - Building Construction

Step 1:

Total Daily Worker Trips (CalEEMod Output)

297	5%	**15**

Total Daily Vendor Trips (CalEEMod Output)

96	5%	**5**

Note: Assumes 5% of Plan Area under construction at given point in time (on average) until buildout.

Worker Trip Length (miles) (CalEEMod Output)

10.8

Vendor Trip Length (miles) (CalEEMod Output)

7.3

Therefore:

Average Worker Daily VMT:

160

Average Vendor Daily VMT:

35

Step 2:

Given:

Assumed Fleet Mix for Workers (Percentage mix is provided on Appendix A: Calculation Details for CalEEMOD p. 15)

LDA	**LDT1**	**LDT2**
0.5	0.25	0.25

Assumed Fleet Mix for Vendors

Fleet Mix for Workers (CalEEMod Output)

MHD	**HHD**
0%	100%

And:

MPG Factors for each Vehicle Class - Year 2023 (EMFAC2021 Output)

Gasoline:

LDA	**LDT1**	**LDT2**
28.9925022	24.00704	23.25365

Diesel:

MHD	**HHD**
8.430063824	5.438606

Therefore:

Weighted Average Worker (Gasoline) MPG Factor

26.3

Weighted Average Vendor (Diesel) MPG Factor

5.4

Step 3:

Therefore:

6 Worker daily gallons of gasoline

Therefore:

6 Vendor daily gallons of diesel

Step 4:

960 **# of Days (CalEEMod Output)**

Therefore:

5,852 Total gallons of gasoline

Therefore:

6,185 Total gallons of diesel

On-road Mobile (Construction) Energy Usage - Paving

Step 1: **Total Daily Worker Trips (CalEEMod Output)**

15

Worker Trip Length (miles) (CalEEMod Output)

10.8

Therefore:

Average Worker Daily VMT:

162

Step 2: Given:

Assumed Fleet Mix for Workers (Percentage mix is provided on Appendix A: Calculation Details for CalEEMOD p. 15)

LDA	**LDT1**	**LDT2**
0.5	0.25	0.25

And:

Gasoline MPG Factors for each Vehicle Class - Year 2023 (EMFAC2021 Output)

LDA	**LDT1**	**LDT2**
28.992502	24.007041	23.253655

Therefore:

Weighted Average Worker MPG Factor

26.3

Step 3: **Therefore:**

6.2 Worker daily gallons of gasoline

Step 4: 110 **# of Days (CalEEMod Output)**

Therefore:

Result: **677** **Total gallons of gasoline**

On-road Mobile (Construction) Energy Usage - Architectural Coating

Step 1: **Total Daily Worker Trips (CalEEMod Output)**

59	5%	3

Note: Assumes 5% of Plan Area under construction at given point in time (on average) until buildout.

Worker Trip Length (miles) (CalEEMod Output)

10.8

Therefore:

Average Worker Daily VMT:

32

Step 2: Given:

Assumed Fleet Mix for Workers (Percentage mix is provided on Appendix A: Calculation Details for CalEEMOD p. 15)

LDA	**LDT1**	**LDT2**

APPENDIX C.3

GHG Calculation Methodology

Greenhouse Gas Efficiency Metric Calculation Methodology – Shepherd North Project

The methodology used for assessing the proposed project's consistency with GHG targets established in AB 32 is the use of GHG efficiency metrics to assess the GHG efficiency of the project on a "service population (SP)" basis (the sum of the number of jobs and the number of residents provided by a project). These metrics represent the rate of emissions needed to achieve a fair share of the state's emissions mandate embodied in AB 32. The use of "fair share" in this instance indicates the GHG efficiency level that, if applied statewide, would meet the AB 32 emissions target and support efforts to reduce emissions beyond 2020.

GHG efficiency metrics for the project were developed based on emissions rates for the land use-driven emission sectors in the CARB's GHG inventory. The GHG efficiency metric is only based on sectors that would accommodate projected growth (as indicated by population and employment growth) while allowing for consistency with the goals of AB 32 (i.e., 1990 GHG emissions levels by 2020). The per service population efficiency target is based on the AB 32 GHG reduction target and GHG emissions inventory prepared for the CARB's 2008 Scoping Plan.

To develop the efficiency metric for 2020, land-use driven sectors in the CARB's 1990 GHG inventory were identified and separated to tailor the inventory to land use projects. This process removes emission sources that would not be applicable to the project area. For example, emissions associated with ships and commercial boats, aviation, rail, industrial sources, agriculture and forestry, and unspecified sectors were removed from the CARB's 1990 inventory in order to exclude non-land use sectors. The exceptions for the industrial sector are the landfill and domestic wastewater sub-sectors which were included in development of the GHG efficiency metric because emissions from these sectors are included in the project's emissions profile. Isolating the land use-driven sectors from the CARB's overall inventory ensures that the threshold is directly applicable to land use projects, whereby emission sectors included in the inventory used for developing the GHG efficiency metric can be mapped to a project's emissions data. For example, emissions associated with on-road transportation, electricity, natural gas, wastewater treatment, and solid waste are included in both the inventory used to develop the GHG efficiency metric and the project's operational emissions. The CARB's complete 1990 inventory and the adjusted land use-driven emissions inventory are shown on the following pages.

The land-use sector driven inventory for 1990 was divided by the population and employment projections for California in 2020. Detailed calculations showing derivation of the efficiency metrics are shown on the following pages. The efficiency metric allows the threshold to be applied evenly to all project types (residential, commercial/retail and mixed use) and uses an emissions inventory comprised only of sources from land-use related sectors. The efficiency approach allows lead agencies to assess whether any given project or plan would accommodate population and employment growth in a way that is consistent with the emissions limit established under AB 32. The resultant GHG efficiency metric would be (approximately) 4.84 MT CO_2e/SP/year for 2020 (as provided below).

The proposed project is anticipated to be built out in year 2028. The CARB has indicated that an average statewide GHG reduction of 5.2 percent per year would be necessary to achieve the 2030 target[1,2]. Therefore, a GHG efficiency goal in terms of metric tons per service population, similar to the one developed for 2020, were estimated for year 2030, allow evaluation of the project's GHG emissions in the post-2020 landscape. The equivalent goal for 2030 computes to approximately 2.62 MT CO_2e/ SP/year. This targets was estimated by applying a uniform reduction from the CARB's 1990 emissions inventory and dividing the resultant value by the projected population and employment in these future years.

These GHG efficiency metric were derived based on the reduction trajectory the state needs to maintain to achieve its 2030 and 2050 goals (an approximately 5.2 percent reduction per year) (CARB, 2016b). All calculations are based on the IPCC Second Assessment Report's Global Warming Potentials to allow consistent comparison between the ARB 1990 inventory and the California Emissions Estimator Model (CalEEMod; used to estimate project emissions).

EXECUTIVE SUMMARY

Argonaut Ecological, Inc. conducted a biological review of Tract 6205 Spensley Property, Clovis, California. Tract 6205 is located at the northeast intersection of E. Shepherd Avenue and N. Sunnyside Avenue. The tract covers roughly 75 acres (See Figure 1). The Study Area has historically been in continuous agricultural production (orchard) for several decades. The findings indicate that the site does not support any wetland or aquatic habitat and the likelihood for the site to support protected species, other than nesting raptors and birds, is low because of the lack of habitat diversity.

1.1 INTRODUCTION

This report presents the findings of a field review and biological assessment conducted to assess the biological resources present and potential biological impacts of site development.

The results include a description of the habitat present and the likelihood for the site to support sensitive biological resources (waters, wetland, and special status species habitat) based on a literature review, database review and a field review. The results indicate that the site has been in continuous intensive agricultural production for many years and the site does not support habitat for any listed or protected species or waters/wetland habitats. One recommendations is included for protection of nesting migratory birds.

1.2 STUDY OBJECTIVES

This review identifies biological resources within the Study Area and describes the suitability of the Study Area to support species of special concern and other biological resources. This review does not, nor was it designed to include exhaustive surveys for special status plant and animal species. Instead the review included a field survey designed to determine the potential for the site to support habitat that may be used or occupied by special status plant and animals species. The study also is designed to determine the approximate extent of potential wetland habitat on the site. “Wetland habitat” includes those areas that may be considered both “Waters of the U.S., as defined by the U.S. Army Corps of Engineers, and/or wetlands as defined by the Army Corps and the State of California. As described in Section 1.2, wetlands are a subset of “Waters of the U.S.” under the Federal Clean Water Act.

This report can be used to assess the potential effects on biological resources if the current land use changes. The specific type of land use change would dictate the type of regulatory approvals or permits required. This review focused on the extent of the Waters of the U.S., including any wetlands that would potentially be subject to regulation under Section 404 of the Clean Water Act or by the State of California Wetland Policy (Resolution 2008-0026) which is designed to protect all waters of the State, including dredge and fill discharges. This study also focused on assessing and identify any potential impacts site development may have on species protected by the Federal Endangered Species Act or protected under the California Environmental Quality Act.

1.3 REGULATORY JURISDICTION AND BACKGROUND

Regulatory jurisdiction over biological resources within the Study Area is shared by several agencies. The following is a brief description of the primary agencies and their respective jurisdiction.

Wetland Protection

U.S. Army Corps of Engineers

The U.S. Army Corps of Engineers (Army Corps) and the U.S. Environmental Protection Agency regulates placement of fill into the Waters of the U.S under Section 404 of the Federal Clean Water Act and Section 10 of the Rivers and Harbor Act. The term “Waters of the U.S.” Include wetlands, special aquatic sites, and other non-wetland waters such as bays, rivers, and lakes. The jurisdictional limit of tidal Waters of the U.S. under Section 10 of the Rivers and Harbor Act is the Mean High Water line. However, Section 404 of the Federal Clean Water Act extends the jurisdictional limit to the High Tide line. The High Tide Line is the highest elevation of the tide in a normal year, excluding storm events. Wetlands adjacent to the Mean High Water line or High Tide Line are also under the USACE jurisdiction. For purposes of this document, the term “Waters of the U.S.” is legally defined under Section 404 of the Federal Clean Water Act. It includes seasonal drainages that have a defined channel and support wetland species, but lack positive indicators of wetland soils.

As previously stated Waters of the U.S. includes wetlands. The Army Corps defines wetland as “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions” (Environmental Laboratory 1987). Seasonally inundated areas that meet the criteria of all three wetland parameters as defined in the recently issued Wetland Delineation Manual for the Arid West (USACE 2006) are also considered jurisdictional wetlands. However, drainage ditches excavated on dry land that do not convey flows from historical streams and/or channels are usually considered non-jurisdictional as defined in Title 33 CFR Part 328.3 (a). A determination of whether any particular area is considered non-jurisdictional varies on a case-by-case basis.

Since 2001, the U.S. Supreme Court found in several court rulings that regulation of isolated intrastate waters by the Army Corps under the Migratory Bird Rule and other arguments is unconstitutional and impinges on state rights to regulate intrastate commerce. The decisions, which include both *Solid Waste Agency of Northern Cook County v. U.S. Army Corps of Engineers* (SWANCC) and *Rapanos v. United States* (Rapanos) limited the scope of federal jurisdiction under the Federal Clean Water Act and excluded many California wetlands from federal regulation.

In May 2015 the U.S. Environmental Protection Agency and the U.S. Army finalized the “Clean Water Rule “with the intent of clarifying what constitutes a waters of the U.S., and presumably, acts to more precisely define and making permitting more predictable, thus less costly and easier. The rule was not intended to create any new permitting requirements for agriculture and maintains all previous exemptions and exclusions. The new Clean Water Rule went in effect at the end of August, 2015. On October 9, 2015 the Sixth U.S. Circuit Court of Appeals issued a nationwide stay of the rule pending further court action. Therefore, currently, application of the Clean Water Rule is not enforced and the current regulatory definition of waters of the U.S. remains.

Executive Order 11990

Executive Order 11990 (signed May 24, 1977) directs all federal agencies to refrain from assisting in or giving financial support to projects that encroach on publicly or privately owned wetlands. It further requires that federal agencies support a policy to minimize the destruction, loss, or degradation of wetlands. A project that encroaches on wetlands may not be undertaken unless the agency in question has determined that: (1) there are no practicable alternatives to such construction; (2) the project includes all practicable measures to minimize harm to wetlands that would be affected by the project; and (3) the resulting impact will be minor.

The Executive Order, the Order does not apply to issuance by Federal Agencies of permits, licenses, or allocation to private parties for activities involving wetland on non-Federal property. Executive Order 1190 is also not intended to be applied on a project by project basis. Section 1 of the order states the following: "*This Order does not apply to the issuance by Federal agencies of permits, licenses, or allocations to private parties for activities involving wetlands on non-Federal property.*"

California State Water Resources Control Board

Since 1993, California has had a Wetlands Conservation Policy (a.k.a., the Executive Order W-51 59-93). Commonly referred to as the *No Net Loss Policy* for wetlands, this order establishes for the State the mandate that it develops and adopts a policy framework and strategy to protect the State's wetland ecosystems.

The State Water Board's Policy is only proposed and no new regulatory authority has been granted to the State of California to regulate wetlands other than what currently exists. Bring a uniform regulatory approach between the State Water Resources Control Board, other agencies involved in aquatic resource protection and the federal Clean Water Act Section 404 program for dredge and fill discharges by establishing procedures and criteria for the application, review and approval of permits to discharge dredged or fill material to waters of the State.

Under the State's 401 Water Quality Certification and Wetland Program, the state provides certification for any proposed fill of waters of the U.S.. Although the State has not historically regulated fills of wetlands/waters of the state, they have boldly asseredt they have the regulatory authority to regulate fills of isolated wetlands/waters under the Porter-Cologne Water Quality Control Act.

Under California's Porter-Cologne Water Quality Control Act (Porter-Cologne), the regional boards regulate the "discharge of waste" to "waters of the state". All parties proposing to discharge waste that could affect waters of the state must file a report of waste discharge with the appropriate regional board. The regional board will then respond to the report of waste discharge by issuing waste discharge requirements (WDRs) in a public hearing, or by waiving WDRs (with conditions) for that proposed discharge.

Both of the terms "discharge of waste" and "waters of the state" are broadly defined in Porter-Cologne, such that discharges of waste include fill, any material resulting from human activity, or any other "discharge" that may directly or indirectly impact "waters of the state". While all "waters of the United States" that are within the borders of California are also "waters of the state", the converse is not true - "waters of the United States" is a subset of "waters of the state." While all "waters of the United States" that are within the borders of California are also "waters of the state", the converse is not true - "waters of the United States" is a subset of "waters of the state." However, a recent court case has provided clarity with respect to the limit to the Regional Boards jurisdiction. The California Superior Court in December 2017 (John D. Sweeney and Point Duck Club, LLC vs. San Francisco Bay Conservation and Development Commission and the San Francisco Regional Water Quality Control Board, FCS048136). In that case the court found that “the California Water Code (Porter-Cologne) §13304 does not give the State the authority (in this case the California Regional Water Quality Control Board) to regulate discharges into areas that are not “waters of the State” and found that “waters of the State” are not areas that are considered dry land (defined as an area that does not have perennial, ephemeral, or intermittent surface waters). The court ruling also made clear that vegetation removal from a waters is not “fill” or “discharge” that can be regulated by the State. At this time, it is unknown how this court ruling will, or will not, change how the Regional Boards proceed with respect to wetland regulation.

It is important to note that, while Section 404 permits and 401 certifications are required when the activity results in fill or discharge directly below the ordinary high water line of waters of the United States, any activity that results or may result in a discharge that directly or indirectly impacts waters of the state or the beneficial uses of those waters are subject to waste discharge requirements (WDRs). In practice, most regional boards rely on applications for 401 certification to determine whether WDRs need also be issued for a proposed project.

Listed Protected Species and Habitat Protection

U.S. Fish and Wildlife Service

The U.S. Fish and Wildlife Service (USFWS) implements the Migratory Bird Treaty Act (16 USC Section 703-711), Bald and Golden Eagle Protection Act (16 United States Code [USC] Section 668), and Federal Endangered Species Act (FESA; 16 USC § 153 *et seq.)*. Projects that would result in “take” of any federally-listed threatened or endangered species are required to obtain authorization from the USFWS through either Section 7 (interagency consultation) or Section 10(a) (incidental take permit) of FESA, depending on whether the federal government is involved in permitting or funding the project. The authorization process is used to determine if a project would jeopardize the continued existence of a listed species and what mitigation measures would be required to avoid jeopardizing the species.

“Take” under the federal definition means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct. “Candidate species” do not have the full protection of FESA. However, the USFWS advises project applicants that it is prudent to address these species since they could be elevated to "listed status" prior to completion of projects with long planning or development schedules.

The **Migratory Bird Treaty Act (MBTA**) was first enacted in 1916 in order to implement the convention for protection of migratory birds between the United States and Great Britain (acting on behalf of Canada). The MBTA makes it illegal for anyone to take, possess, import, transport, purchase, barter or offer for sale or purchase any migratory birds, its nests or eggs unless a permit has been issued by the federal agency. The USFWS has statutory authority and responsibility for enforcing the MBTA. In accordance with the MBTA Reform Act (MBTARA) of 2004 all species native to the U.S. or its territories which occur as a result of natural biological or ecological processes (70 FR 12710, March 15, 2005) and does not include nonnative species whose occurrences in the US are solely the result of intentional or unintentional human introduction. The USFWS maintains a list of bird species protected under the MCTA and the MBTRA.

On December 22, 2017, the U.S. Department of the Interior, Office of the Solicitor issued a memorandum 37050 that clarified that under the Migratory Bird Treaty Act does not prohibit incidental "take" or "killing" of migratory birds as a result activities perform as part of an otherwise lawful activity.

California Department of Fish and Wildlife

The California Department of Fish and Wildlife (CDFW), formally known as the California Department of Fish and Game, is a Trustee Agency with responsibility under the CEQA for commenting on projects that could impact plant and wildlife resources. In addition, pursuant to the Fish and Game Code Section 1802, the CDFW has jurisdiction over the conservation, protection, and management of fish, wildlife, native plants, and the habitat necessary for biologically sustainable populations of those species. The California Fish and Game Code also provide authority for the CDFW to regulate projects that could result in the "take" of any species listed by the State as threatened or endangered (Section 2081).

Perennial and intermittent streams also fall under the jurisdiction of CDFW pursuant to Sections 1601-1603 of the Fish and Game Code (Streambed Alteration Agreements). The CDFW's jurisdiction over work within the stream zone includes, but is not limited to, the diversion or obstruction of the natural flow or changes in the channel, bed, or bank of any river, stream or lake. Prior to issuing a 1601 or 1603 Streambed Alteration Agreement, the CDFW must demonstrate compliance with CEQA. In most cases, CDFW relies on the CEQA review performed by the local lead agency. However, in cases where no CEQA review was required for the project, CDFW would act as the lead agency under CEQA.

The CDFW also has authority for protection state-listed species issues Section 2081 Incidental Take Permit if a project has the potential to negatively affect state-protected plant or animal species or their habitats, either directly or indirectly. Protected species include those "listed" by the state as endangered or threatened. Besides listed species, there are other categories of species protection, including "fully protected" and California Species of Special Concern (CSC). Adverse impacts to species that have the "fully protected" designation are prohibited.

Under current California Fish & Game Code (FGC Section 3503) “it is unlawful to take, posses or needlessly destroy the nest or eggs of any bird…” Birds of prey (falcons, hawks, owls and eagles) get extra protection under the law (FGC Section 3503.5).

California Endangered Species Act

The California Endangered Species Act (CESA) provides protection for candidate plants and animal species as well as those listed as rare, threatened, or endangered by the California Department of Fish and Game (CDFG). This act prohibits the take of any such species unless authorized. Section 2081 authorizes the state to issue incidental take permits. The state definition of take applies only to acts that result in the death of or adverse impacts to protected species.

California Environmental Quality Act

The CEQA Guidelines require review of projects to determine their environmental effects and to identify mitigation for significant effects. The Guidelines state an effect may be significant if it affects rare and endangered species. Section 15380 of the Guidelines defines *rare* to include listed species, and allows agencies to consider rare species other than those designated as State or federal threatened or endangered, but that meet the standards for rare under the federal or State endangered species acts. On this basis, plants designated as rare by non-regulatory organizations (e.g., California Native Plant Society), species of special concern as defined by CDFW, candidate species as defined by USFWS and other designations may need to be considered in CEQA analyses.

City of Clovis

The Study Area falls within the City of Clovis, California. The City is responsible for all local land use decisions within its jurisdictional boundary.

SECTION 2 **METHODS**

The following section describes the methods used to assess the Study Area, which includes a combination of data review and evaluation, field studies, and aerial photograph interpretations.

2.1 DATA AND LITERATURE REVIEW

The approximately 75-acre Study Area is located within an historically developed with rural residential and agricultural that has been undergoing redevelopment into higher density residential within the City of Clovis, California. The following documents and/or sources were used in preparing this report.

- U.S. Department of Agricultural, Natural Resources Conservation Service, Soil Survey of Fresno Area (Soils mapper).
- Aerial photography (Google Earth®, Bing®, and historic aerials dating back to 1983).
- The California Department of Fish and Game, California Natural Diversity Database (CNDDB/RareFind - Recent version with updates).
- U.S. Fish and Wildlife Service National Wetland Inventory Map
- U.S. Fish and Wildlife Service Information for Planning and Conservation (IPaC)
- University of Texas, Austin, Perry-Castañeda Map Collection
- AcreValue® (accessed at www.acrevalue.com)
- Previous experience with biological studies, CEQA reviews, and wetland delineation work on lands adjacent to the Study Area.

2.2 AERIAL PHOTOGRAPHY AND WETLAND MAPPING

A series of aerial photographs of the Study Area were reviewed to assess changes in land use over time, dating back to 1998. Specifically, black and white and color aerial photographs ranging in resolution from 0.5 meters to 1.0 meter. We also reviewed wetland mapping and the aerials to determine if the Study Area recently supported wetlands.

2.3 FIELD RECONNAISSANCE

Prior to conducting a site review, we reviewed the California Natural Diversity Database/ Rarefind (CNDDB/Rarefind). The CNDDB includes records of reported observations for special status plant and animal species. A search radius that included up to nine USGS quadrangles was employed. The results of the CNDDB/RareFind were reviewed to identify which species would present the greatest likelihood of being present on the site based on the distance of the site from known records and the similarity in habitats between the Study Area and the habitats that the species required and/or preferred. Also prior to the field work, a high resolution aerial was reviewed to determine if there are any areas on the site that appear to support waters of the U.S., or other water features.

On October 23, 2017 a site review was conducted. The entire site was reviewed. There were no access issues. The primary objective of the field work was to identify any areas on the site, or immediately adjacent to the site, that potentially supports habitat for sensitive species or aquatic habitat. The orchard manager provided historical and current information on the farming operations.

The following section describes the physical (i.e., topography, drainage, and soils) and the biological resources present, or potentially present, within the Study Area. Section 3.1 describes the physical components (i.e., soils, hydrology, etc.) of the Study Area. The physical components strongly influence the types of plants and animals present. Section 3.2, is an overview of the resources and habitats present within the Study Area, including descriptions of the specific biological resources observed.

The information presented is not an exhaustive inventory of plants or animals present. Rather it is designed to provide sufficient information to identify what, if any, biological resources are present that may be considered unique, sensitive, or protected by current law and the potential impacts to those resources if the site is developed.

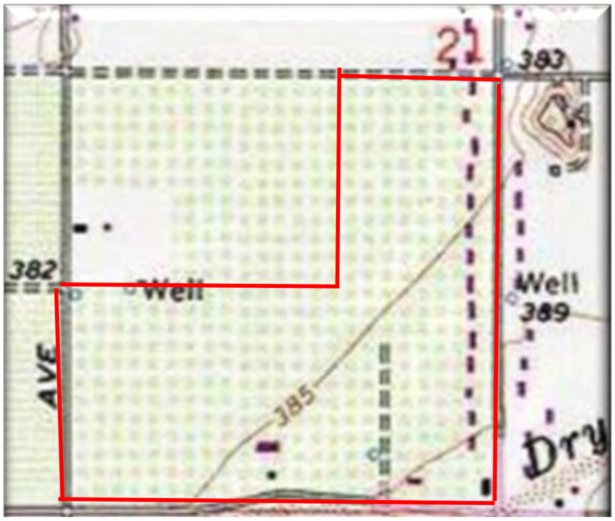
3.1 PHYSICAL RESOURCES AND ELEMENTS

Land Use and Habitat Types

Based on the aerials, the site has been developed as orchard/agricultural since before 1998. No significant changes have been made to the property since at least 1998. The two buildings that are within the three parcels that make up the Study Area have been there at least since 1998. The Study Area is surrounded by rural residential to the North, East, and South that has likewise undergone relative minor changes since at least 1998.

Site Topography

The property lies within the Central Valley. The Study Area is flat with very little change in elevation. Elevation is approximately 385 meters above sea level ranges from 385 meters above sea level to 390 meters above sea level. Dry Creek is located at the immediately south and east of the Study Area.

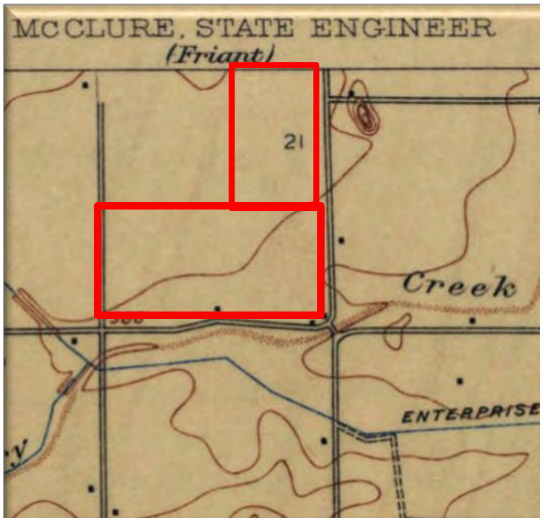


USGS Topographic Map

Drainage and Watershed and Wetlands

The study area has historically drained to the southwest. The site is fairly flat with little change in elevation. Historically there was a small lake that was located north of the Study Area and has since been filled. A topographic map from 1919 (right) shows the general vicinity of the Study Area, circled in red.

The project site historically drained to the west. A query of the National Wetland Inventory Map does not show any stream, creeks, or wetland on the Study Area. The National Wetland Inventory Map code is "PUBHx" which correlates to "palustrine, unconsolidated bottom, permanently flooded, excavated."



USGS Historical Topographic Map (1919)

**U.S. Fish and Wildlife Service
National Wetland Inventory Map**

Climate/Soils

Climate in the Study Area is typical of the central San Joaquin Valley with summers that are long, hot, and dry and winters that are cool and mild. Rainfall in the winter averages approximately 10.9 inches per year, falling mainly between November and April (Western Regional Climate Center, 2004).

The Natural Resources Conservation Service (NRCS) soil survey mapped six soils types within the Study Area. Four of the mapped soils are considered hydric soils. Hydric soil is readily formed under ponded condition and is a strong indicator of areas experiencing prolonged ponding (e.g., wetlands). The presence of mapped hydric soils may indicate that the soils could support wetlands; but, there is not a direct correlation. Wetlands can occur in areas where no hydric soil are mapped and may be absent in areas mapped as hydric soils. The following is a summary of the soil types present.

Table 1
NRCS Soils Within Tract 6205, Spensley Property

Map Unit Symbol	Map Unit Name	Hydric		Approximate Acres in Area of Interest	Percent of Area of Interest
		Yes	No		
ArA	Atwater sandy loam, 0 to 3 percent slopes		✓	11.7	15.3%
Gf	Grangeville fine sandy loam, 0 to 1 percent slopes	✓		21.8	28.6%
Gg	Grangeville fine sandy loam, saline alkali	✓		3.3	4.3%
Re	Ramona loam, hard substratum		✓	20.2	26.5%
SeA	San Joaquin loam, 0 to 3 percent slopes	✓		11.2	14.7%
VaA	Visalia sandy loam, 0 to 3 percent slopes	✓		8.1	10.6%
Totals for Area of Interest				**76.3**	**100%**

3.2 RESULTS OF SITE INVESTIGATION

Habitats and Waters of the U.S. and Waters of the State

The entire Study Area is made up of orchard habitat. There are two residential homes on the site along with one outbuilding. Based on a review of historical records, readily available wetland mapping databases, and a site review, our field investigation confirmed the accuracy of the U.S. Fish and Wildlife Service's Wetland Inventory Map. No wetlands, waters, or any aquatic habitat is present within the Study Area. There is a man-made conveyance channel (trapezoidal with no vegetation) located along the northern boundary, but outside the project limits.

The entire property was walked and driven. The orchards trees are mature and are roughly 20 feet in height. We observed a barn owl in flight within the orchard. As we walked another large raptor was seen flying from tree to tree. It appeared to be a red-tailed hawk. Surrounding the home sites there are landscaped areas and bare ground. It appears that a rodent control program is in place because no burrowing rodents were observed. The areas surrounding the orchard trees is bare ground.

Special Status Species

A search of the California Natural Diversity Database (CNDDB) was reviewed to determine which special status species could be present within the Study Area. There is no critical habitat for any listed species within or near the Study Area. Table 2 provides a summary of the species identified in the CNDDB and by the by the U.S. Fish and Wildlife Service that would have the highest likelihood of being present based on habitat requirements. Species that are dependent on the presence of seasonal water bodies, such as vernal pool or other seasonal wetlands, for breeding or completion of their life cycle are not included in the table present because no wetland, vernal pools, or seasonal wetland are present within the Study Area.

Although the database did not include all migratory birds/ and raptors, such species could use the site to forage for food or nest the trees.

The nearest records are for two species: Western pond turtle (*Actinemys marmorata*) and California tiger salamander (*Ambystoma californiense*). The Western pond turtle record is located to the southeast, south of Shepherd Avenue. The California tiger salamander (CTS) record is located to the northeast along Dry Creek. California tiger salamanders occupy different habitat depending on the state of their life cycle and breeding cycle. CTS requires seasonal ponds that retain water till at least May or June in order to successfully breed and young to mature. Once the aquatic larva have matured, they relocate to the dry upland habitat to aestivate during the hot dry summers. Once the winter rains return, the adults return to the seasonal ponds to breed. Typically they breed in seasonal wetlands, ponds (including some farm ponds) or in slow-moving portion of creeks. The upland habitat they use is typically grassland or ruderal habitat that has friable soils and supports a burrowing rodent (CTS use rodent burrows during aestivation). CTS have been reported to travel up to 1.3 miles between breeding habitat and upland habitat.

Tract 6205 does not support any aquatic habitat that could support Western pond turtle or California tiger salamander. The channel/ditch located immediately north of the Study Area remains dry unless except perhaps in response to groundwater pumping or some return flows from the orchard (personal conversation with the orchard manager, 2017). The ditch does not pond water but instead has a flashy hydrologic regime (days). Western pond turtle requires persistent ponded water which does not occur within the Study Area. The channel/ditch is also not suitable habitat for CTS because the lack of sufficient ponding. The orchard habitat within the Study Area is devoid of a underground rodent population. Because both suitable breeding habitat and upland habitat are absent, the site would not support CTS.

California Tiger Salamander

California tiger salamander (*Ambystoma californiense*) is both federally and state listed as endangered. CTS is endemic to California and the historical presence of it likely includes grassland habitats that are found throughout the state. The primary cause for decline in populations has been habitat loss and fragmentation due to urban and agricultural development, land conversion, and other human-caused factors. California tiger salamander occupy different habitats depending on the state of their life cycle and breeding cycle. CTS require seasonal ponds that retain water until at least May or June in order to successfully breed and the young to mature. Once the aquatic larvae have matured, they relocate to the dry upland habitat to aestivate (oversummer) during the hot dry summers, seeking shelter in underground burrows. Once the winter rains return and suitable ponding has occurred, the adults return to the seasonal ponds to breed. During years of low rainfall the males may migrate into the seasonal ponds but the females may remain in their upland habitat. There appears to be a strong association between grazed communities, burrowing mammals, and the presence of CTS (USDOI 2009). Adults will find burrows dug by California ground squirrels (*Otospermophilus beecheyi*) and pocket gophers (*Thomomys bottaeto*) to aestivate (Barry and Shaffer 1994, Trenham 2001).

Typically CTS breed in seasonal wetlands, ponds (including some farm ponds) or in slow moving portions of creeks. The upland habitat they use is typically grassland or ruderal habitat that has friable soils and supports a burrowing rodent. CTS have been reported to travel up to 1.3 miles between breeding habitat and upland habitat.

The nearest California tiger salamander (CTS) record (occurrence record # 613) is located south of the Study Area, just southwest of the intersection of Nees Avenue and N. Fowler Avenue. This record is from 1974 and the species was found in a vernal pool. Jennings considered this record extirpated (species no longer present), since the land has since been converted to dense residential.

A second CTS record was found in the CNDDB. This record (occurrence record # 888) is located to the northeast along Dry Creek (1.5 miles from the center of the Study Area, and 1.3 miles from the eastern edge of the Study Area). This record is from 2006 and CTS larva was found in a swale adjacent to the man-made Dry Creek channel just below the Big Dry Reservoir. The surrounding land has vernal pool and other seasonal wetlands.

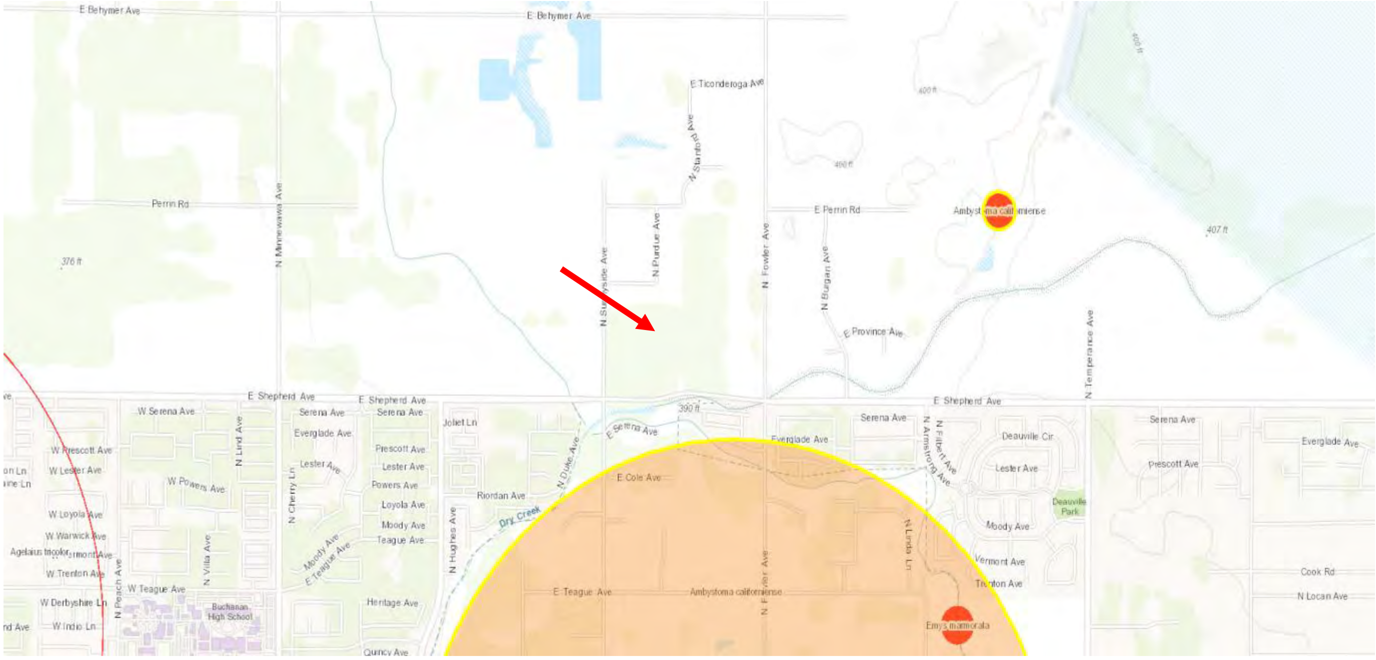
The Study Area may support some ground burrowing mammals; however because of the marginal quality of habitat, evidence of a rodent control program being implemented onsite, the residential developing surrounding the site, which likely presents a physical barrier to CTS migration, ,and distance from the closest CTS breeding habitat, it is highly unlikely this site provides suitable CTS aestivation habitat.

Table 2
Summary of Potential Special Status Species Impacts
Tract 6205 Spensley Property

Common Name	*Scientific Name*	*Status[1]*	*Effects[2]*	*Occurrence in the Study Area[3]*
Birds				
Barn owl	*Tyco alba*	None	ME	**Potentially Present.** Suitable nesting habitat is present. One owl observed in flight. Farm operator reported he has also observed barn owl(s) in past years on the site.
Burrowing owl	*Athene cunicularia*	SSC	ME	**Likely Absent.** No individuals in area of effect but possible habitat for burrows is present
Swainson's hawk	*Buteo swainsoni*	CT	ME	**Likely Absent** The orchard may provide some foraging habitat, but suitable nesting habitat is unlikely.
Tricolored blackbird	*Agelaius tricolor*	SC[4]	NE	**Absent.** Suitable habitat not present.
Western yellow-billed cuckoo	*Coccyzus americanus occidentalis*	CE, FT	ME	**Likely Absent.** Suitable breeding habitat is not present
Mammals				
Fresno kangaroo rat	*Dipodomys nitratoides*	CE, FE	NE	**Absent**. No individuals in area of effect
San Joaquin kit fox	*Vulpes macrotis mutica*	CT, FE	NE	**Absent**. No individuals in area of effect. No suitable habitat present to support species. Unlikely visitor even for hunting because site is surrounded by dense urban areas.
Aquatic Species (or semi aquatic)				
Western pond turtle	*Emys marmorata*	None	NE	**Absent:** No habitat present to support the species**.**
California tiger salamander	*Ambystoma californiense*	FT/CT	NE	**Likely Absent:** No suitable breeding habitat and low quality upland habitat present.

1 Status= Listing of special status species, unless otherwise indicated
CE: California listed as Endangered
CT: California listed as Threatened
SSC: California Species of Special Concern
FE: Federally listed as Endangered
FT: Federally listed as Threatened

2 Effects = Effect determination
NE: No Effect
ME: May effect, not likely to adversely affect
3 Definition Of Occurrence Indicators
Present/Potentially Present: Species recorded in area and suitable habitat likely present
Absent/Likely Absent: Species not recorded in study area and/or
CNDDB = California Natural Diversity Database provided by CDFG



CNDDB Bio Mapping Showing Record of Known Species
(The arrow points to the Study Area)

Swainson's hawk

Swainson's hawk (*Buteo swainsoni*) is state threatened and is a migrant species that spends much of the spring, summer, and early fall in California's Central Valley. Their preferred nesting habitat consists of valley oaks, cottonwoods, and other tall trees adjacent to both agricultural fields and grasslands. They have been observed more frequently in recent years within the Central Valley. Due to the recent expansion of their population, it is possible that agricultural, grassland, and rural residential areas may support foraging and possibly nesting hawks.

Burrowing Owl

The burrowing owl is a species of concern in California. It is a small owl that typically lives in grassland habitats of the Central Valley region that also support California ground squirrels. The species will also sometimes overwinter or even nest within agricultural areas, using whatever is available (pipes, ground holes/burrows). The owl seeks shelter and breeds from February to July. Although the numbers of owls have declined in some parts of California over the past 20 years, their numbers have increased greatly in some agricultural areas. In Fresno County, the species mostly occurs on the valley floor.

The orchard and ruderal habitat within the Study Area may provide some suitable foraging and nesting habitat for the species. While no owls were observed on the site, the species can occupy a site at any time assuming there is a suitable burrow available.

Other Migratory Nesting Birds

There are several species of migratory and resident nesting birds that could potentially use the project site for nesting area. The USFWS lists 23 migratory bird species in the area however the project site does not support the habitat needed by every species for breeding or wintering. The following selected species are representative of the variety of species identified in the CNDDB and USFWS list.

Western yellow-billed cuckoo (*Coccyzus americanus occidentalis*) breeds in the Central Valley of California. It breeds in woodlands and orchards. The study Area provides suitable habitat for this species. There is no critical habitat in the Study Area.

3.3 CONCLUSIONS AND RECOMMENDATIONS

Conclusions

The Study Area has been developed as agricultural as an orchard since at least 1998. The site does not support any wetland habitat or waters of the U.S. The potential for the property to support any species of concern is extremely low because of the lack of habitat diversity. A nesting bird survey may be warranted given the trees on the site could support raptor nesting or other species status birds or migratory birds. Potential mitigation for any land conversion would require that tree removal occurring during the non-nesting period (Feb-Aug). If tree removal occurs during the nesting period, then a pre-construction survey should be performed to identify any occupied nest.

INTRODUCTION

Project Description

The Shepherd North Project (Project) site is located directly north of the City of Clovis limit line at the northeast corner of North Sunnyside Avenue and East Shepherd Avenue. The Project site is bounded on the north by Perrin Road, on the east by North Fowler Avenue, on the south by East Shepherd Avenue, and on the west by North Sunnyside Avenue. Figures 1, 2 and 3 show the proposed Project's regional location and vicinity. The Project site is in the southwest quadrant of Section 21, Township 12 South, Range 21 East, Mount Diablo Base and Meridian (MDBM). Figure 2 illustrates the Project location on the USGS Clovis, California, 7.5-minute series quadrangle map.

The Project site includes several distinct planning boundaries. The following terms are used throughout this document to describe planning area boundaries within the Project site:

- Project Area – Includes the whole of the Project site (approximately 155 acres), encompassing the approximate 77-acre Development Area and the approximate 78-acre Non-Development Area.
    - Development Area - Includes the parcels being annexed that will be entitled for subdivision and development. This will include a General Plan Amendment, Pre-zone, Annexation, Tentative Map, Planned Development Permit, and Residential Site Review.
    - Non-Development Area - Includes the parcels being included in the Sphere of Influence (SOI) expansion that will not be entitled for subdivision or development. This includes two separate areas, each described as an Expansion SubArea. The two Expansion SubAreas total 78 acres and are defined as Expansion SubArea North and Expansion SubArea East.

The Project site is approximately 155 acres and includes 39 Assessor parcels (APNs), as depicted in Figures 4, 5, 6, 7, and 8. The Project site is relatively flat and is approximately 385 feet above mean sea level.

The Development Area primarily contains farmland (orchard). Three residential dwellings and a warehouse were removed in approximately 2020. The majority of the Development Area is in active agricultural use (pecan orchards).

Five agricultural water wells are located in the Development Area; two located along the east-west centerline of the area, one located in the southwestern corner of the area, one located in the northwestern corner of the area and one located along the eastern boundary of the Development Area. Four pole-mounted transformers are located in the Development Area; two are located in the central-eastern portion of the Development Area and two are located along the eastern boundary of the Development Area in the southern portion. Two 10-12-foot-tall berms containing wood branches and debris from orchard pruning are located along the eastern boundary of the Development Area.

The Non-Development Area is located within the City of Clovis' Planning Area but is outside of the City's existing Sphere of Influence and contains existing single-family residences and agricultural fields. Each SubArea is uniquely different and is described below:

> Expansion SubArea North: Includes single-family residences that are accessed by North Purdue Avenue and Lexington. North Purdue Avenue and Lexington are unimproved roadways with no pedestrian sidewalk, curb/gutter, or landscaping. North Sunnyside Avenue located to the west and Perrin Road to the north are also unimproved County roadways. There are 18 APNs in SubArea North.
>
> Expansion SubArea East: Includes single-family residences and agricultural fields located between the pecan orchards and North Fowler Avenue. North Fowler Avenue is a two-lane unimproved County roadway with no pedestrian sidewalk, curb/gutter, or landscaping. There are 18 APNs in SubArea East.

The Project site is surrounded by a variety of agricultural and residential land uses. Uses immediately adjacent to the north and east boundary of the Project site include rural residential uses on larger lots, some having small orchards or other agricultural activities. Uses to the south of the Project site contain a mix of residential uses, as well as rural residential on larger lots and medium-high density residential in a developed smaller lot residential subdivision. West of the Project site are agricultural uses (orchard) and a power sub-station.

The City and County General Plan land use designations and zoning for the Project site. The Project site is currently outside of the jurisdiction of the City of Clovis, and therefore does not have a City of Clovis zoning designation, but the City of Clovis General Plan (adopted on August 25, 2014) designated the Project site as Rural Residential (RR). This designation allows very low-density residential uses and small-scale agricultural operations. Rural residential uses may be dispersed uniformly across the land or be sited so to leave more acreage for orchards, pastures, or other agricultural or open space activities. The allowable maximum density for this land use designation is one dwelling unit per two acres.

The Development Area is designated as Low Density Residential by the County's General Plan Land Use Map and is zoned AL-20 (Limited Agricultural) by the County. The Non-Development Area is designated as Rural Residential by the County's General Plan Land Use Map and is zoned RR (Rural Residential) by the County.

Project Goals and Objectives

Project

A clear statement of objectives and the underlying purpose of the proposed Project are discussed per CEQA Guidelines Section 151024(b).

The principal Project objective is the expansion of the City's SOI to include the Project site, and the annexation, approval and subsequent development of the Development Area.

The quantifiable objectives include the development of 605 single family residential units. The quantifiable objectives include the development of open space totaling 4.32 acres, including 1.49 acres of private park and recreational uses. The Project objectives also include the installation of new public and private roadways that will provide pedestrian and vehicular access to the Project site and surrounding community areas, and other improvements, including water supply, storm drainage, sewer facilities and landscaping to serve the residential uses.

The goals of the proposed development are as follows:

- Provide residential housing opportunities that are visually attractive and accommodate the future housing demand in Clovis.
- Establish a mixture of housing types, sizes and densities that collectively provide for local and regional housing demand.
- Provide infrastructure that meets City standards and is integrated with existing and planned facilities and connections.
- Establish a logical phasing plan designed to ensure that each phase of development would include necessary public improvements required to meet City standards.
- Expand the City's Sphere of Influence in order to establish a logical and orderly boundary that promotes the efficient extension of municipal services.

Project Entitlements

The proposed Project will require a General Plan Land Use Amendment to adjust the land uses from Rural Residential (RR) to Medium Density (M) and Medium High Density (MH) for the Development Area to accommodate the proposed development density.

- **Medium Density (M)** This designation identifies area appropriate for detached and attached single family homes, patio homes, or zero lot line homes. The allowable density range is 4.1–7.0 units per acre.

- **Medium High Density (MH).** This designation identifies areas appropriate small lot single family detached homes, townhouses, duplexes, and apartments. The allowable density range is 7.1 to 15.0 units per acre.

The Project site is currently located outside of the Clovis city limits, and therefore does not have City-designated zoning. The proposed Project includes a request for Development Area pre-zoning (which is consistent with the proposed General Plan Land Uses):

Development Area: The pre-zoning request is for R-1-PRD zoning designations over these lots.

- **Single-Family Planned Residential Development Zoning (R-1-PRD).** This designation identifies areas appropriate for single-family small lot uses, including attached and detached single-family structures on small lots. The allowable density range is 4.1 to 15.0 units per acre, with the level of density determined by compliance with performance standards. The R-1-PRD district required a planned development permit. The R-1-PRD district is consistent with the Medium and Medium-High Density Residential land use designation of the General Plan.

The proposed Project includes a Tentative Map for the Development Area that is planned for development in phases. The Tentative Map covers approximately 77 acres within three Assessor parcels (APNs); 557-021-20, -19, and -21.

The Tentative Map will result in the subdivision of a total of approximately 77 acres into 605 single family residential units, with an additional 58 out lots for roads, utilities, greenspace, landscaping, and pedestrian paths. The Project objectives also include the installation of new public roadways that will provide pedestrian and vehicular access to the Project site and surrounding community areas, and other improvements, including water supply, storm drainage, sewer facilities and landscaping.

The proposed Project includes a Planned Development Permit (PDP) for the Development Area of the Project, which will incorporate a program of enhanced amenities (e.g., additional open space, park improvements and/or trail development). The PDP may allow for modifications to the applicable development standards, such as lot coverage, setbacks and building heights.

Figures 6, 7 and 8 illustrate the proposed site plans for the Development Area.

The proposed Project includes an annexation of three APNs totaling approximately 77 acres. This acreage includes the Development Area.

The proposed Project includes a Residential Site Plan Review (RSPR) for the Development Area as a condition of a subdivision map implementing provisions of zoning.

The proposed Project includes an amendment of the City's Sphere of Influence (SOI) to include the entirety the approximately 155-acre Project site. The area is currently located in the City's

Planning Area, but outside of the City's SOI. The amendment of the City's SOI will require an application and approval by the Fresno County Local Agency Formation Commission (LAFCO).

Development Project Characteristics

The proposed Project is primarily a residential development anticipated to provide up to 605 residential units. The Development Project would provide approximately 1.49 acres of private greenspace. Other uses to support and compliment the proposed residential development include public utility infrastructure, public and private roadways, curb/gutters/sidewalks, pedestrian facilities, private parking, street lighting, and street signage.

Housing development will depend on market conditions and demand. The plan for infrastructure allows for development to occur in phases to respond to the market conditions and demand.

The proposed Project will provide a variety of housing types and lot sizes that will accommodate a range of housing objectives and buyer needs with a goal to ensure housing for a variety of families and lifestyles. The Development Area will accommodate up to 605 residential units. Specifically, the northern portion of the Development Area is planned to include the development of up to 107 single-family residences with lot sizes ranging from approximately 7,500 square feet to 19,300 square feet. The southern portion of the Development Area is planned for smaller lot single-family residences, with lot sizes ranging from approximately 1,980 to 3,800 square feet, and with larger corner lots that are approximately 4,200 to 7,300 square feet. Figures 6, 7, and 8 illustrate the Project site plans.

The proposed Project includes 1.49 acres of private greenspace including a private pool and park area. There are three separate greenspaces proposed, one located in the northern portion of the Development Area, one in the southwestern portion and one in the southeastern portion.

The proposed Project includes a hierarchy of roadways to accommodate the capacity needs of the existing street network as well as provide additional vehicular access to the Development Area. North Sunnyside Avenue and East Shepherd Avenue are the main arterial roadways providing access to the Development Area.

The neighborhoods within the Development Area will include a network of public and private residential streets to provide an efficient flow of traffic through the area. Sidewalks will also be included per the City standards.

Utilities and Planned Infrastructure Improvements

The construction of on-site infrastructure improvements would be required to accommodate development of the Development Area, as described below.

Water System

The Project site will be served by a new potable and non-potable water distribution system. The proposed water system will be located within the proposed public utilities easements and be connected to existing City mains and will comply with City Master Plans and standards. The City of Clovis provides water supplies to the City of Clovis. The City has three main water supply sources: groundwater, surface water, and recycled water. The City extracts groundwater from the Kings Subbasin. Surface water is delivered to the City by the Fresno Irrigation District (FID). The various surface water supplies are from the Kings River and Central Valley Project. The City's Water Reuse Facility produces tertiary treated effluent that can be used for agriculture or landscape irrigation.

Wastewater System

The Project site will be served by a new wastewater collection system installed within proposed public utilities easements. The proposed wastewater conveyance facilities will connect to the existing sewer mains as part of the City of Clovis collection and treatment system. Wastewater treatment will be provided at the existing Fresno-Clovis Regional Wastewater Treatment Plant in the City of Fresno. By agreement with the City of Fresno, the City of Clovis is entitled to a maximum capacity of 9.3 million gallons per day (mgd). The Fresno-Clovis Regional Wastewater Treatment Plant is owned and operated by the City of Fresno and has a maximum capacity of 80 mgd. If required, the City has the capability to acquire additional capacity at the Wastewater Treatment Plant. Wastewater treatment will also be provided by the City's Water Reuse Facility. The plant serves the new growth areas of the City in the southeast, northwest, and ultimately the northeast urban centers. The plant is designed to accommodate future expansion and will ultimately treat 8.4 mgd.

Storm Drainage

The Project site will include construction of a new storm drainage system, which will confirm to applicable standards and requirements. The storm drainage collection and detention system will be subject to the State Water Resources Control Board Requirements (SWRCB), the Fresno Metropolitan Flood Control District (FMFCD), and City of Clovis regulations, standards, and specifications. This includes, but not limited to the municipal NPDES storm water discharge permit, as well as any City required Best Management Practices to control the volume, rate, and potential pollutant load of storm water runoff. Stormwater throughout the City is collected in FMFCD's basins.

Regulated Public Utilities

Electrical and gas, provided by PG&E; phone, provided by AT&T; cable, provided by Comcast; and related internet services would be extended to all portions of the Project site from existing facilities located along E. Shepherd Avenue and from existing residential development surrounding the Project site. Proposed utilities would be located within public utility easements to be dedicated along street frontages. Utility improvements would be installed in conjunction with planned street improvements.

Alternatives Considered

Three alternatives to the proposed Project were developed based on input from City staff. The alternatives that are anticipated to be analyzed in the EIR include the following three alternatives in addition to the proposed Project.

- **No Project (No Build) Alternative**: Under this alternative, development of the Project site would not occur, and the Project site would remain in its current existing condition.
- **Increased Density Alternative:** Under this alternative, the proposed Project would be developed with the same number of units as described in the Project Description, but the density of the residential uses would be increased, reducing the overall footprint of the developed areas and preserving the remaining Development Area for agricultural production.
- **Reduced Sphere of Influence Alternative:** Under this alternative, the proposed Project would exclude the 78-acre SOI Expansion north and east of the Development Area.

Under the No Project (No Build) Alternative development of the Project site would not occur, and the Project site would remain in its current existing condition. It is noted that the No Project (No Build) Alternative would fail to meet the Project objectives.

Under this alternative, the proposed Project would be developed with the same components as described in the Project Description, but density of the residential uses would be increased. Under the Increased Density Alternative, the same number of residential units as the proposed Project (607 units) would be constructed within the Development Area. The residential areas would be reduced at increased densities of approximately 9.8 dwelling units per acre (du/ac) to allow for the preservation of approximately 15 acres agricultural lands. The residential density under the Increased Density Alternative would fall within the allowed density for the City's General Plan designation of Medium High Density Residential (7.1 to 15 du/ac). Under the proposed Project, the residential density would be 5.2 units per gross acre.

Under this alternative, the proposed Project would only expand the Sphere of Influence and annex the Developed Area and would exclude the 78-acre Sphere of Influence (SOI) expansion to the north and east of the Development Area.

Uses of the EIR and Required Agency Approvals

This EIR may be used for the following direct and indirect approvals and permits associated with adoption and implementation of the proposed Project.

The City of Clovis will be the Lead Agency for the proposed Project, pursuant to the State Guidelines for Implementation of CEQA, Section 15050. Actions that would be required from the City include, but are not limited to the following:

- Certification of the EIR;

- Adoption of the Mitigation Monitoring and Reporting Program;
- Approval of City of Clovis General Plan Amendment (Land Use Element);
- Approval of City of Clovis Zoning Pre-zoning;
- Approval of Residential Site Plan Review;
- Approval of Vesting Tentative Maps;
- Approval of Planned Development Permit;
- Approval of SOI Expansion and Authorization to submit SOI Amendment request to Fresno LAFCO;
- Approval of Annexation of the Development Area and Inhabited Area and Authorization to submit Annexation request to Fresno LAFCO;
- Approval of future Final Maps;
- Approval of future Planned Development Permit;
- Approval of future Grading Plans;
- City review, approval, of construction and utility plans; and
- Approval of future Building Permits.

The following agencies may be required to issue permits or approve certain aspects of the proposed Project. Other governmental agencies that may require approval include, but are not limited to, the following:

- Fresno Local Agency Formation Commission (LAFCO) – SOI Amendment, Annexation, and Detachment from the Fresno County Fire Protection District and the Kings River Conservation District;
- Central Valley Regional Water Quality Control Board (CVRWQCB) - Storm Water Pollution Prevention Plan (SWPPP) approval prior to construction activities pursuant to the Clean Water Act;
- San Joaquin Valley Air Pollution Control District (SJVAPCD) - Approval of construction-related air quality permits; and
- Fresno Metropolitan Flood Control District – review of stormwater facilities, grading, and street improvements.

STATE REGULATIONS

State historic preservation regulations affecting this project include the statutes and guidelines contained in the California Environmental Quality Act (CEQA; Public Resources Code sections 21083.2 and 21084.1 and sections 15064.5 and 15126.4 (b) of the CEQA Guidelines). CEQA Section 15064.5 requires that lead agencies determine whether projects may have a significant effect on archaeological and historical resources. Public Resources Code Section 21098.1 further cites: A project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment.

An “historical resource” includes, but is not limited to, any object, building, structure, site, area, place, record or manuscript that is historically or archaeologically significant (Public Resources Code section 5020.1).

Advice on procedures to identify such resources, evaluate their importance, and estimate potential effects is given in several agency publications such as the series produced by the Governor’s Office of Planning and Research (OPR), *CEQA and Archaeological Resources,* 1994. The technical advice series produced by OPR strongly recommends that Native American concerns and the concerns of other interested persons and corporate entities, including, but not limited to, museums, historical commissions, associations and societies be solicited as part of the process of cultural resources inventory. In addition, California law protects Native American burials, skeletal remains, and associated grave goods regardless of the antiquity and provides for the sensitive treatment and disposition of those remains (California Health and Safety Code Section 7050.5, California Public Resources Codes Sections 5097.94 et al).

The California Register of Historical Resources (Public Resources Code Section 5020 et seq.)

The State Historic Preservation Office (SHPO) maintains the California Register of Historical Resources (CRHR). Properties listed, or formally designated as eligible for listing, on the National Register of Historic Places are automatically listed on the CRHR, as are State Landmarks and Points of Interest. The CRHR also includes properties designated under local ordinances or identified through local historical resource surveys.

For the purposes of CEQA, an historical resource is a resource listed in, or determined eligible for listing in the California Register of Historical Resources. When a project will impact a site, it needs to be determined whether the site is an historical resource. The criteria are set forth in Section 15064.5(a) (3) of the CEQA Guidelines, and are defined as any resource that does any of the following:

A. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

B. Is associated with the lives of persons important in our past;

C. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or

D. Has yielded, or may be likely to yield, information important in prehistory or history.

In addition, the CEQA Guidelines, Section 15064.5(a) (4) states:

The fact that a resource is not listed in, or determined to be eligible for listing in the California Register of Historical Resources, not included in a local register of historical resources (pursuant to section 5020.1(k) of the Public Resources Code), or identified in an historical resources survey (meeting the criteria in section 5024.1(g) of the Public Resources Code) does not preclude a lead agency from determining that the resource may be an historical resource as defined in Public Resources Code section 5020.1(j) or 5024.1.

California Health and Safety Code Sections 7050.5, 7051, And 7054

These sections collectively address the illegality of interference with human burial remains, as well as the disposition of Native American burials in archaeological sites. The law protects such remains from disturbance, vandalism, or inadvertent destruction, and establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project, including the treatment of remains prior to, during, and after evaluation, and reburial procedures.

California Public Resources Code Section 15064.5(e)

This law addresses the disposition of Native American burials in archaeological sites and protects such remains from disturbance, vandalism, or inadvertent destruction. The section establishes procedures to be implemented if Native American skeletal remains are discovered during construction of a project and establishes the Native American Heritage Commission as the entity responsible to resolve disputes regarding the disposition of such remains.

Assembly Bill 52

Assembly Bill (AB) 52 establishes a formal consultation process for California tribes as part of CEQA and equates significant impacts on tribal cultural resources with significant environmental impacts. AB 52 defines a "California Native American Tribe" as a Native American tribe located in California that is on the contact list maintained by the Native American Heritage Commission. AB 52 requires formal consultation with California Native American Tribes prior to determining the level of environmental document if a tribe has requested to be informed by the lead agency of proposed projects. AB 52 also requires that consultation address project alternatives, mitigation measures, for significant effects, if requested by the California Native American Tribe, and that consultation be considered concluded when either the parties agree to measures to mitigate or avoid a significant effect, or the agency concludes that mutual agreement cannot be reached. Under AB 52, such measures shall be recommended for inclusion in the environmental document and adopted mitigation monitoring program if determined to avoid or lessen a significant impact on a tribal cultural resource.

CULTURAL SETTING

Archeology

The Central Valley region was among the first in the state to attract intensive fieldwork, and research has continued to the present day. This has resulted in a substantial accumulation of data, but the emphasis has been in the northern portion of the valley. In the early decades of the 1900s, E.J. Dawson explored numerous sites near Stockton and Lodi, later collaborating with W.E. Schenck (Schenck and Dawson 1929). By 1933, the focus of work was directed to the Cosumnes locality, where survey and excavation were conducted by the Sacramento Junior College (Lillard and Purves 1936). Excavation data, in particular from the stratified Windmiller site (CA-SAC-107), suggested two temporally distinct cultural traditions. Later work at other mounds by Sacramento Junior College and the University of California, Berkeley, enabled the investigators to identify a third cultural tradition, intermediate between the previously postulated Early and Late Horizons. The three-horizon sequence, based on discrete changes in ornamental artifacts and mortuary practices, as well as on observed differences in soils within sites (Lillard, Heizer and Fenenga 1939), was later refined by Beardsley (1954). An expanded definition of artifacts diagnostic of each time period was developed, and its application extended to parts of the central California coast. Traits held in common allow the application of this system within certain limits of time and space to other areas of prehistoric central California.

In the southern San Joaquin Valley, with the exception of Hewes's excavation at CA-FRE-48 (the Tranquility Site), the foci of early investigations have been the old shorelines of the interior lakes; Tulare, Kern, and Buena Vista. In 1899, Dr. P. M. Jones directed fieldwork in the Buena Vista-Tulare Lake area of Kern County. Jones investigated 150 mounds and conducted trenching of several sites including CA-KER-53. In 1909, N. C. Nelson investigated prehistoric Site CA-KER-49, which is located to the west of Buena Vista Lake. Later, four surveys and excavations were conducted in the same locale under the auspices of the University of California. A compilation of these investigation results was published in 1926 by Gifford and Schenck.

As a result of this early work, an elaborate culture complex was defined for the late prehistoric period. This complex can be ascribed probably to the Yokuts and their direct ancestors. The material culture of this late temporal period complex included steatite vessels and beads, finely-made projectile points, pottery, shaped stone mortars, *Tivela* disc beads, use of asphaltum, and the presence of metates and manos. Flexed burials were the predominant interment mode. Earlier complexes underlying the late cultural expressions were represented by chipped stone crescents, large projectile points, atlatl spurs, and weights. Mortuary practices, generally thought to be related, include extended rather than flexed burial position, a situation analogous to that of the northern valley (Gifford and Schenck 1926; Lillard, Heizer, and Fenenga 1939; Moratto 1972).

Presence of “Early Man,” although not found in direct association with extinct animals, is demonstrated by the frequency of chipped stone crescents and fluted points similar to those of the Clovis-Folsom Complex in the American Southwest. Although fluted points have been found near the shores of Tulare Lake, an area that has also produced surface finds of extinct mammal bone of Pleistocene age, the association is not substantiated by controlled excavations and remains speculative (Riddell and Olsen 1969). Most of the point collection had been acquired by D. Witt over a period of 30 years.

Under the direction of Wedel (1941), the Civil Works Administration, in conjunction with the Smithsonian Institution, initiated the first major excavations using stratigraphic controls. Investigations of CA-KER-39 and CA-KER-60 as well as several smaller sites near Buena Vista Lake produced evidence of two distinct cultural entities or occupation periods. Wedel lacked methods for dating these two entities by cross-comparison of the assemblages, he tentatively stated that the early occupation at Buena Vista Lake appeared to be temporally older and less developed than the Early Horizon (Windmiller Pattern) of the Delta region. He compared this early component to the Oak Grove or Milling Stone culture of the Santa Barbara area (Rogers 1939). He divided the later cultural entity into two distinct phases, both clearly distinguished from the earlier cultural phase by artifact types. Wedel (1941:144-145) estimated that neither of these cultural periods exceeded 1500 B.P. (years Before the Present). Later, other investigators proposed far earlier ages for these early occupations, with dates ranging from 2000 to 7000 B.P. (Baumhoff and Olmstead 1963, 1964; Heizer 1964; Meighan 1959).

Later investigations in 1963 and 1964 at CA-KER-116 near Buena Vista Lake produced materials similar to Wedel’s early occupation. These materials occurred in the lower levels of the “upper deposit,” while an even deeper cultural deposit yielded materials similar to those of the San Dieguito Complex. Artifacts included a chipped stone crescent, crude point fragments, and an atlatl spur. Radiocarbon age determinations on shell from the lowest cultural levels returned a date of circa 8200 B.P. (Fredrickson and Grossman 1966, 1977; Fredrickson 1967).

Despite the previously mentioned investigations, the prehistory of the southern San Joaquin remains as yet poorly understood, without a tightly defined chronological sequence of cultural development.

Ethnology

Ethnographic literature is often uncertain in definition of cultural boundaries for Indian groups. Early displacement by white intrusion resulted in population shifts to avoid conflict with the Spanish, and later with the miners and settlers. The ravages of disease and warfare decimated the native people, further weakening cultural identity. Informants were often uncertain of original territories of the various tribal groupings.

The Foothill Yokuts were members of the Penutian language family which held all of the Central Valley, San Francisco Bay Area, and the Pacific Coast from Marin County to near Point Sur. The Yokuts differed from other ethnographic groups in California as they had true tribal divisions with group names (Kroeber 1925). Each tribe spoke a particular dialect, common to its members, but similar enough to other Yokuts that they were mutually intelligible (Kroeber 1925).

The Foothill Yokuts were a group of about 15 named tribes who occupied the western Sierra Nevada foothills from the Fresno River to the Kern River. A further subdivision separated the groups into northern, central and southern groups. The area controlled by individual groups varied over time. There is no information to indicate that there was a village in the project vicinity, but this does not preclude the possibility.

Trade was well developed, with mutually beneficial interchange of needed or desired goods. Obsidian, rare in the San Joaquin Valley, was obtained by trade with Paiute and Shoshoni groups on the eastern side of the Sierra Nevada, where numerous sources of this material are located, and to some extent from the Napa Valley to the north. Shell beads, obtained by the Yokuts from coastal people, and acorns, rare in the Great Basin, were among many items exported to the east by Yokuts traders (Davis 1961).

Economic subsistence was based on the acorn, with substantial dependency on gathering and processing of wild seeds and other vegetable foods. The rivers, streams, and sloughs which formed a maze within the valley provided abundant food resources such as fish, shellfish, and turtles. Game, wild fowl, and small mammals were trapped and hunted to provide protein augmentation of the diet. In general, the eastern portion of the San Joaquin Valley provided a lush environment of varied food resources, with the estimated large population centers reflecting this abundance (Cook 1955; Baumhoff 1963).

Settlements were oriented along the water ways, with their village sites normally placed adjacent to these features for their nearby water and food resources. House structures varied in size and shape (Latta 1949; Kroeber 1925). The housepit depressions ranged in diameter from between 3 to 18 meters.

Latta (1949:99) reported that a village of 200 to 300 Yokuts might have four or five large houses that were used for ten or twelve years or until a family member died, at which time the Indians burned the house in which the death had occurred. If a sick or aged person died outside the dwelling, the family did not burn the house. When a Northern Yokuts died, his body was cremated or buried in a flexed position. Southern tribes normally buried their dead, although they did cremate shamans, persons who died away from their village and, among the Tachi, persons of great importance.

The Yokuts experienced severe depopulation after contact with the Spanish and subsequent explores. The most devastating impacts of the Spanish colonization effort were not the result of military conflicts, but came from Old World diseases newly introduced to the native people.

Historical Context

Early Explorations

The early recorded inhabitants of the region were members of the Yokuts tribe. Although the Spanish missions were established closer to the Pacific coast between 1769 and 1817, the general project area was first visited in the early 1800s by Spanish explorers, who visited the San Joaquin Valley with three goals: to search for runaway neophytes from the missions in the coastal regions, to punish the Indian raiders, and to select sites for new missions. In 1806, a group led by Gabriel Moraga and Father Pedro Muñoz, left Mission San Juan Bautista heading north to about the Mokelumne River. They then turned south, and travelled along the edge of the mountains crossing the San Joaquin River and passing through Tejon Pass, arriving at Mission San Fernando. In 1815, José Dolores Pico marched an expedition group from Monterey into the region. Following the San Joaquin River, he passed through the area in search of runaways, traveling as far south as the Kern River. The expedition returned to the starting point in Monterey with nine prisoners and a number of horses.

After control of California passed from Spain to Mexico in 1822, Mexican explorations into the interior continued, with José Dolores Pico conducting a major expedition along the San Joaquin River in 1825-1826. This expedition was considered successful in that some neophytes were captured, hostile Indians killed, some of the tribal groups intimidated, and some stolen horses recovered. In 1828, Sebastián Rodríguez led a similar expedition into the same region. His expedition captured a number of neophytes as well as some of the stolen horses, an item that had become an important dietary staple for the Indian tribes in the San Joaquin Valley region (Beck and Haase 1974).

The expeditions did not leave physical evidence, but there were definitely effects to the Native American populations. Causing even more of an effect on the native population were the diseases brought in to the Native populations of the Central Valley in the early 1830s.

Ranchos

In Fresno County, there was only one early land grant, a rancho along the current southern border of the county: Laguna de Tache. The era of the Spanish and Mexican land grants did not directly affect the project area.

Clovis

The extension of the railroad system throughout the San Joaquin Valley allowed the increased expansion of a market for the agricultural production of the region. A branch line of the Southern Pacific Railroad (first known as the Pollasky Railroad or the San Joaquin Railroad) was built through this region circa 1891. Marcus Pollasky served as the promoter, and monies were raised locally for the construction costs. Clovis Cole, the owner of the large wheat ranch, donated land for the route, and a station was established here on the line and named Clovis (Gudde 1969; City of Clovis 1962).

After the completion of the railroad, the construction of the flume from Shaver Lake to the east was soon completed by the Fresno Flume and Irrigation Company. The 45-mile-long flume could deliver 200,000 board feet of lumber through the vee-shaped watercourse in a 24-hour period. At the end of the flume, there was a finishing and distributing plant. Other, better grade lumber was delivered to Clovis down Tollhouse Grade, hauled by ox and horse teams. In the early years, 140 men were employed by the lumber company, with an annual payroll of $450,000. The Clovis lumber plant occupied a 40 acre site. The factory, warehouse, planing mill and engine house all burned to the ground in 1898, but were soon rebuilt. As many as 400 men were employed by the company. The mill was located on the south side of Fifth Street (City of Clovis 1962; Clovis Centennial Book Committee 2011).

The mill in Clovis produced "ordinary lines of lumber," shakes, trays, sweat boxes, raisin boxes, orange boxes, cedar posts, ties, poles, and also pine and oak cordwood (*Fresno Republican* 1897: 96). The ever increasing agricultural use of the San Joaquin Valley, due to improvements and expansion of irrigation systems, led to a large market for the fruit packing boxes, allowing shipment of the produce to a wider marketplace.

Clovis was laid out by a licensed surveyor, working for the co-owners of the land: Clovis Cole, Clarence Pallos and George Owen. Early homes were utilitarian, and the streets were ungraded (City of Clovis 1962).

The town's population expanded rapidly from about 500 residents in 1905 to about 1,000 in 1910. Nearby, the population was increasing within the local rural agricultural colonies, with large acreages broken up into 20 acre tracts advertised for sale to Midwesterners. By 1919, local population had grown to 1,500. At this point, the lumber business is still the main support of the economy, but the area produced huge crops of Malaga grapes and figs (Clovis Centennial Book Committee 2011; Vandor 1919:269)

For the first 21 years, there was no organized government in Clovis. Late in 1911, and election was held, and the City incorporated in 1912. Most of the early businesses in town were located on Front Street, now known as Clovis Avenue, on the west side of the tracks (City of Clovis 1962).

Historical Background for the Development Area

The early use of land in the Big Dry Creek region was for cultivation of wheat. Improvements such as the development of the railroad, allowing marketing of more perishable crops, and irrigation canals, providing a steady source of water year round, also encouraged the growth of crops such as grapes. The establishment of orchards and vineyards allowed more profitability with smaller tracts of land, and many pieces of land were subdivided as portions of agricultural colonies.

Much of the project site is a portion a 160-acre tract first acquired by Rebecca Wilson Norman Strother in 1873 as a land patent. Strother had been born in Mississippi in 1818, and had eight daughters and one son, who died as a child, with her husband. He died in Mississippi in 1868, and she travelled west to Fresno County. Mrs. Strother apparently did not reside on the land, but likely transferred ownership to one of her daughters who did choose to live in the region.

In 1880, Mrs. Strother lived in Santa Rosa with two of her unmarried daughters (Federal census 1880). Her will was prepared at this time, leaving her estate to the two unmarried daughters, and specifically excluding the married daughters. She died in 1883.

One of the daughters, Laura Strother, also acquired land in the area, the land immediately north of the Project site consisting of the northwest quarter of section 21.

William Shipp was married to a Strother daughter, Mary. He brought his family to California in 1868. The Shipps acquired large tracts of land in the Big Dry Creek area, and ran large herds of sheep. It appears that this land may have been part of the Shipp place.

Early maps show the Enterprise Canal near the Project Area. The Enterprise Canal had been constructed by 1891, south of the Project site (Thompson 1891).

In 1891, R. T. Owen owned the south half of section 21, including the land of the Project site. In 1892, he lived in the Temperance Township according to voter records, so it cannot be certain where precisely he lived without further research.

Owen, his father and brother had been farmers and ranchers in the area. He continued to raise grain in the region until 1902. The 1891 map shows a building to the east of the current building on Owen's holding. A 1919 biography describes the R.T. Owen residence as "the first fine house in Clovis," suggesting he lived closer to the early townsite after he sold the project area.

By 1907, the south half of section 21 and the northeast quarter of the section had been acquired by Hugh Bissell (Official County Map 1907).

Hugh Bissell, a native of Iowa, had farmed for a number of years in Missouri, and came to California in 1885. He first settled in Modesto, then a year later, moved to Fresno County. He had a ranch near Fresno, that he sold in 1898. He leased a tract of about 3,000 acres for dry grain farming. He quit grain farming in 1906, and purchased 320 acres of what was known as the Shipp place for $20 an acre. Bissell also purchased the northeast quarter of the section, so his ranch totaled 480 acres. Bissell wanted to improve the land for intensive farming, so he sank wells and found that the water readily came to the ground surface. Even though others thought it impossible, he installed a pumping plant for irrigation. With a six-inch centrifugal pump, run by a twenty-horsepower engine, he was able to irrigate the land, and set up the first vineyard above the ditch. He made a success of the vineyard and the orchard on the property, later irrigated by a total of three pumping plants (Vandor 1919; Official Map of Fresno County 1907).

In 1910, the residents of the Project Area included High Bissell, a widower since 1908, his daughter-in-law (widowed in 1909), his grandson William, son Ralph, six hired men, and a house servant (Federal Census 1910). It is not certain where the residents were housed on the property. The large residence appears to date to about 1915.

At various points, Bissell sold off portions of the ranch, and in 1919, had 160 acres, including the much of the Project site. The land had increased in value from $20 an acre to $750 an acre.

In a 1919 biography, Bissell was credited with having developed “a wonderfully productive and valuable place, and erecting a large comfortable residence, constructed of cement blocks, making it one of the show places of the district.”

As well as his involvement in viticulture and horticulture, Bissell served as a director for the National Bank of Clovis. Bissell also served with various groups related to the production of raisins (Vandor 1919).

The family remained on the property until an unknown date. By 1920, Hugh Bissell had moved to Fresno. By 1930, his son Raymond had moved with his family to Madera. The later history of ownership and use of the residence is not known. It currently houses an employee and family of the former landowner, Cal Pecan.

ENVIRONMENTAL SETTING

The Development Area portion of the project area contains a mosaic of six soil series with the northern most San Joaquin loam, with Ramona loam located to the south of that. Atwater sandy loam is located to the south and west of Ramona loam along the western edge. Grangeville fine sandy loam and Grangeville fine sandy loam saline alkali occupies the southern portion with Visalia sandy loam in a pocket in the southeast portion (www.usds.gov).

San Joaquin loam is derived from decomposed granite deposited by alluvial action. It is up to five feet thick with a restricted layer (hardpan) at about three feet in depth. Ramona loam is also derived from decomposed granite deposited by alluvial action. It is slightly shallower than neighboring San Joaquin loam but has a much more pronounced restrictive layer also at a depth of about three feet (www.usda.gov)

Grangeville fine sandy loam and Grangeville fine sandy loam saline alkali are both derived from decomposed granite with the saline alkali series being a more recent deposition. Both soil series average about 80 inches in depth with no restrictive layer present. Visalia sandy loam, like its neighbor to the north, Grangeville fine sandy loam saline alkali is also recently deposited decomposed granite and is about five feet thick with no restrictive layer present (www.usda.gov).

San Joaquin loam was deposited during the Early to Mid-Pleistocene and is considered to have a very low potential for buried cultural resources. Atwater sandy loam was deposited during the Late Pleistocene and is thought to have a low potential for buried cultural resources (Rosenthal and Meyer 2004: Appendix D).

Grangeville fine sandy loam and Grangeville fine sandy loam saline alkali were deposited very recently during the historic period and are believed to have a very high sensitivity for buried cultural resources (Rosenthal and Meyer 2004: Appendix D).

The Development Area portion of the project area has no surface water however Dry Creek is located adjacent to the southern boundary. Overall, the northern portion has a low sensitivity for buried cultural resources while the southern portion near Dry Creek has a moderate to high potential based on the much more youthful age of the sediments and setting adjacent to Dry Creek.

RESEARCH

A record search has been conducted for the North Shepherd Project site and a 0.25-mile radius through the South San Joaquin Valley Information Center of the California Historical Resources Information System (RS#22-461, Appendix 2).

The project area includes one recorded resource, P-10-07197. Formerly, the site was a 1909 residence, recorded in 2017 by Peak & Associates. The residence has been removed from the property, and the former location appears to lie in a non-development area, not proposed for housing.

Within the search area radius, there are three recorded resources, all historic period resources. They include: P-10-005511, two branches of the Helm Colonial Ditch; P10-005934, a section of the Enterprise Canal; and P-10-007198, a residence at 4707 N. Preuss Avenue.

Four surveys surveys have been reported within the Project site. Bissonette's 1993 survey is shown to have included hundreds of acres of land in the region including the Project site. We believe it is not plotted correctly by the SSJVC, in part due to the lack of a survey coverage map in the report (FR-01219). Bissonette only spent two days doing fieldwork, and said she walked along the pipelines and channel routes with transects and within a five meter radius of proposed culverts.

Varner reportedly surveyed the major portion of the Development Area in 2001 with negative findings. He did note the presence of the historic building (FR-02203), but did not record it during his survey.

Peak & Associates conducted a complete, intensive survey of the Development Area in 2017 (FR-3009), recording the historic residence at the southern boundary (Figure 9). One other negative survey for a cell tower was conducted by Lossee in 2006 (FR-02285) in the eastern portion of the Project site. Several cultural resource surveys have been conducted in the vicinity of the Project site. Full report citations and survey locations are included in Appendix 2.

RECOMMENDATIONS

Although no prehistoric sites were found during the survey of the Development Area, there is a slight possibility that a site may exist and be totally obscured by vegetation, fill, or other historic activities, leaving no surface evidence. In particular, the former location of the residence adjacent to the natural

course of Dry Creek and the southern section of the Development Area is sensitive. An archeological monitor is advised during any grading and trenching in the southern portion, particularly near the former location of the residence.

Should artifacts or unusual amounts of stone, bone, or shell be uncovered during construction activities, an archeologist should be consulted for on-the-spot evaluation of the finding. If the bone appears to be human, state law requires that the Fresno County Coroner be contacted. If the Coroner determines that the bone is human and is most likely Native American in origin, he must contact the Native American Heritage Commission (916-322-7791).

If additional parcels in the Project site are to be developed in the future, a cultural resources survey shall be conducted to identify and evaluate any prehistoric or historic period resources that may be present.

APPENDIX 1

Resume

PEAK & ASSOCIATES, INC.
RESUME

MELINDA A. PEAK **January 2023**
Senior Historian/Archeologist
3941 Park Drive, Suite 20 #329
El Dorado Hills, CA 95762
(916) 939-2405

PROFESSIONAL EXPERIENCE

Ms. Peak has served as the principal investigator on a wide range of prehistoric and historic excavations throughout California. She has directed laboratory analyses of archeological materials, including the historic period. She has also conducted a wide variety of cultural resource assessments in California, including documentary research, field survey, Native American consultation and report preparation.

In addition, Ms. Peak has developed a second field of expertise in applied history, specializing in site-specific research for historic period resources. She is a registered professional historian and has completed a number of historical research projects for a wide variety of site types.

Through her education and experience, Ms. Peak meets the Secretary of Interior Standards for historian, architectural historian, prehistoric archeologist and historic archeologist.

EDUCATION

M.A. - History - California State University, Sacramento, 1989
Thesis: *The Bellevue Mine: A Historical Resources Management Site Study in Plumas and Sierra Counties, California*
B.A. - Anthropology - University of California, Berkeley

PROJECTS

In recent years, Ms. Peak has led the team completing the cultural resource sections for General Plan and General Plan Updates, for a number of cities/neighborhoods including Campbell, Milpitas, Yountville, Manteca, The Springs, Sebastopol, Martinez, Brentwood, Colusa County and Foster City. Older General Plan efforts include Wheatland, Rocklin, Sheridan, Granite Bay and South Sutter County.

In recent months, Ms. Peak has completed a number of determinations of eligibility and effect documents in coordination with the Corps of Engineers for projects requiring federal permits, assessing the eligibility of a number of sites for the National Register of Historic Places.

She has also completed historical research and historic site evaluation projects on a wide variety of topics for a number of projects including the development of a winery in a ranch in Folsom, commercial buildings in the City of Davis, a lumber mill in Clovis, levees, warehouses, older farmhouses dating to the 1860s, an early roadhouse, bridges, canals, a former small-town site, and a section of an electric railway line.

In recent years, Ms. Peak has prepared a number of cultural resource overviews and predictive models for blocks of land proposed for future development for general and specific plans. She has been able to direct a number of surveys of these areas, allowing the model to be tested.

Ms. Peak completed the cultural resource research and contributed to the text prepared for the DeSabla-Centerville PAD for the initial stage of the FERC relicensing. She also served cultural resource project manager for the FERC relicensing of the Beardsley-Donnells Project. For the South Feather Power Project and the Woodleaf-Palermo and Sly Creek Transmission Lines, her team completing the technical work for the project.

She served as principal investigator for the multi-phase Twelve Bridges Golf Club project in Placer County. She served as liaison with the various agencies, helped prepare the historic properties treatment plan, managed the various phases of test and data recovery excavations, and completed the final report on the analysis of the test phase excavations of a number of prehistoric sites.

Ms. Peak has served as project manager for a number of major survey and excavation projects in recent years, including the many surveys and site definition excavations for the 172-mile-long Pacific Pipeline proposed for construction in Santa Barbara, Ventura and Los Angeles counties. She also completed an archival study in the City of Los Angeles for the project, and served as principal investigator for a major coaxial cable removal project for AT&T.

Additionally, she completed a number of small surveys, served as a construction monitor at several urban sites, and conducted emergency recovery excavations for sites found during monitoring. She has directed the excavations of several historic complexes in Sacramento, Placer and El Dorado Counties.

Ms. Peak is the author of a chapter and two sections of a published history (1999) of Sacramento County, *Sacramento: Gold Rush Legacy, Metropolitan Destiny*. She served as the consultant for a children's book on California, published by Capstone Press in 2003 in the Land of Liberty series.

Please forward a copy of any resulting reports from this project to the office as soon as possible. Due to the sensitive nature of archaeological site location data, we ask that you do not include resource location maps and resource location descriptions in your report if the report is for public distribution. If you have any questions regarding the results presented herein, please contact the office at the phone number listed above.

The provision of CHRIS Data via this records search response does not in any way constitute public disclosure of records otherwise exempt from disclosure under the California Public Records Act or any other law, including, but not limited to, records related to archeological site information maintained by or on behalf of, or in the possession of, the State of California, Department of Parks and Recreation, State Historic Preservation Officer, Office of Historic Preservation, or the State Historical Resources Commission.

Due to processing delays and other factors, not all of the historical resource reports and resource records that have been submitted to the Office of Historic Preservation are available via this records search. Additional information may be available through the federal, state, and local agencies that produced or paid for historical resource management work in the search area. Additionally, Native American tribes have historical resource information not in the CHRIS Inventory, and you should contact the California Native American Heritage Commission for information on local/regional tribal contacts.

Should you require any additional information for the above referenced project, reference the record search number listed above when making inquiries. Invoices for Information Center services will be sent under separate cover from the California State University, Bakersfield Accounting Office.

Thank you for using the California Historical Resources Information System (CHRIS).

Sincerely,

Jeremy E David
Assistant Coordinator

GEOTECHNICAL ENGINEERING INVESTIGATION
PROPOSED TRACT 6205 (SPENSLEY PROPERTY)
SUNNYSIDE AND SHEPHERD AVENUES
CLOVIS, CALIFORNIA

INTRODUCTION

This report presents the results of our Geotechnical Engineering Investigation for the proposed Residential Development, identified as Tract 6205 (Spensley Property) to be located at the northeast corner of Sunnyside Avenue and Shepherd Avenue in Clovis, California. Discussions regarding site conditions are presented herein, together with conclusions and recommendations pertaining to site preparation, Engineered Fill, utility trench backfill, drainage and landscaping, foundations, concrete floor slabs and exterior flatwork, retaining walls, soil cement reactivity and pavement design.

A site plan showing the approximate boring locations is presented following the text of this report. A description of the field investigation, boring logs and the boring log legend are presented in Appendix A. Appendix A contains a description of laboratory testing phase of this study; along with laboratory test results. Appendices B and C contain guides to earthwork and pavement specifications. When conflicts in the text of the report occur with the general specifications in the appendices, the recommendations in the text of the report have precedence.

PURPOSE AND SCOPE

This investigation was conducted to evaluate the soil and groundwater conditions at the site, to make geotechnical engineering recommendations for use in design of specific construction elements and to provide criteria for site preparation and Engineered Fill construction.

Our scope of services was outlined in our proposal dated December 10, 2018 (KA Proposal No. P739-18) and included the following:

- A site reconnaissance by a member of our engineering staff to evaluate the surface conditions at the project site.
- A field investigation consisting of drilling 19 borings to depths ranging from approximately 10 to 20 feet for evaluation of the subsurface conditions at the project site.
- Performing laboratory tests on representative soil samples obtained from the borings to evaluate the physical and index properties of the subsurface soils.

With Offices Serving The Western United States
215 West Dakota Avenue • Clovis CA 93612 • (559) 348-2200 • Fax: (559) 348-2201

- Evaluation of the data obtained from the investigation and an engineering analysis to provide recommendations for use in the project design and preparation of construction specifications.
- Preparation of this report summarizing the results, conclusions, recommendations, and findings of our investigation.

PROPOSED CONSTRUCTION

We understand that design of the proposed development is currently underway; structural load information and other final details pertaining to the structures are unavailable. On a preliminary basis, it is understood that development will consist of single family residential lots. It is understood the buildings will be single- or two-story wood-framed structures utilizing concrete slab-on-grade construction. Footing loads are anticipated to be light to moderate. On-site landscaping and roadways will be associated with the project.

In the event these structural or grading details are inconsistent with the final design criteria, the Soils Engineer should be notified so that we may update this writing as applicable.

SITE LOCATION, SITE HISTORY AND SITE DESCRIPTION

The site is irregular in shape and encompasses approximately 75.05 acres. The site is located at the northeast corner of Sunnyside Avenue and Shepherd Avenue in Clovis, California. The site is predominately surrounded by residential developments, rural residential developments and agricultural land.

Site history was obtained by reviewing historical aerial photographs taken in 1998, 2006 and 2015. Review of the 1998 aerial photograph indicates the project site predominately consisted of agricultural land occupied by an orchard. A rural residential development with associated barns and sheds was located in the southern portion of the site. In addition, a rural residential development was located in the northeastern portion of the site. Furthermore, a maintenance shed was located in the central-east portion of the site.

Review of the 2006 and 2015 aerial photographs indicate that the project site conditions appeared to be relatively similar to that noted in the 1998 aerial photograph.

Presently, the site conditions appear relatively similar to that noted in the previous aerial photographs. Two rural residential developments with associated barns and sheds are located in the southern and northern portions of the site. In addition, a maintenance building is located in the central-east portion of the site. The remainder of the site is occupied by an orchard. Gravel and paved driveways were located within portions of the site. Buried utility lines are located within the site associated with the existing developments. Portions of the site are covered by a sparse to moderate weed growth and the surface soils have a loose consistency. The site is relatively level with no major changes in grade.

GEOLOGIC SETTING

The San Joaquin Valley, which includes the Clovis area, is a topographic and structural basin that is bounded on the east by the Sierra Nevada and on the west by the Coast Ranges. The Sierra Nevada, a fault block dipping gently southwestward, is made up of igneous and metamorphic rocks of pre-Tertiary age that comprise the basement complex beneath the Valley. The Coast Ranges contain folded and faulted sedimentary rocks of Mesozoic and Cenozoic age, which are similar to those rocks that underlie the Valley at depth and nonconformably overlie the basement complex; gently dipping to nearly horizontal sedimentary rocks of Tertiary and Quaternary age overlie the older rocks. These younger rocks are mostly of continental origin and in the Clovis area, they were derived from the Sierra Nevada.

The San Joaquin River is the principal river in the area. Alluvial fans formed by this river are the largest geomorphic features in the Clovis area. The formation of the fans has resulted in rather flat regional topography.

The Coast Ranges evolved as a result of folding, faulting and accretion of diverse geologic terrains. They are composed chiefly of sedimentary and metamorphic rocks that are sharply deformed into complex structures. They are broken by numerous faults, the San Andreas Fault being the most notable structural feature.

Both the Sierra Nevada and Coast Range are geologically young mountain ranges and possess active and potentially active fault zones. Major active faults and fault zones occur at some distance to the east, west and south of the Clovis area. The Owens Valley Fault Zone bounds the eastern edge of the Sierra Nevada block and contains both active and potentially active faults.

Portions of the Ortigalita, Calaveras, Hayward and Rinconada Faults, which are to the west, are considered potentially active. The San Andreas Fault is possibly the best known fault and is located approximately 60 to 70 miles to the west.

There are no active fault traces in the project vicinity. Accordingly, the project area is not within an Earth Quake Fault Zone (Special Studies Zone) and will not require a special site investigation by an Engineering Geologist.

Clovis residents could feel the affects of a large seismic event on one of the nearby active or potentially active fault zones. Clovis has experienced groundshaking from earthquakes in the historical past. According to the Five County Seismic Safety Element, groundshaking of VII intensity (Modified Mercali Scale) was felt in Clovis from the 1872 Owens Valley Earthquake. This is the largest known earthquake event affecting the Clovis area.

Secondary hazards from earthquakes include rupture, seiche, landslides, liquefaction and subsidence. Since there are no known faults within the immediate area, ground rupture from surface faulting should not be a potential problem. Seiche and landslides are not hazards in the area either. Liquefaction potential (sudden loss of shear strength in a saturated cohesionless soil) should be low since groundwater occurs below 60 feet. Lastly, deep subsidence problems may be low to moderate according to the conclusions of the Five County Seismic Safety Element. However, there are no known occurrences of structural or architectural damage due to deep subsidence in the Clovis area.

FIELD AND LABORATORY INVESTIGATIONS

Subsurface soil conditions were explored by drilling 19 borings to depths ranging from approximately 10 to 20 feet below existing site grade, using a truck-mounted drill rig. In addition, 4 bulk subgrade samples were obtained from the site for laboratory R-value testing. The approximate boring and bulk sample locations are shown on the site plan. During drilling operations, penetration tests were performed at regular intervals to evaluate the soil consistency, obtain information regarding the engineering properties of the subsoils and to retain soil samples for laboratory testing. The soils encountered were continuously examined and visually classified in accordance with the Unified Soil Classification System. A more detailed description of the field investigation is presented in Appendix A.

Laboratory tests were performed on selected soil samples to evaluate their physical characteristics and engineering properties. The laboratory-testing program was formulated with emphasis on the evaluation of natural moisture, density, gradation, shear strength, consolidation potential, expansion potential, R-value and moisture-density relationships of the materials encountered. In addition, chemical tests were performed to evaluate the soil cement reactivity. Details of the laboratory test program and the results of laboratory test are summarized in Appendix A. This information, along with the field observations, was used to prepare the final boring logs in Appendix A.

SOIL PROFILE AND SUBSURFACE CONDITIONS

Based on our findings, the subsurface conditions encountered appear typical of those found in the geologic region of the site. The upper soils are identified as by the Soil Conservation Service as belonging to the Atwater, Grangeville, Hanford, Ramona, San Joaquin and Visalia Series. These Series are often underlain at a shallow depth by a clayey or cemented substratum locally referred to as "hardpan." The soils within these Series generally consist of sands, silts, and occasional clays.

More specifically, the surface soils consisted of approximately 6 to 12 inches of very loose silty sand, silty sand with trace clay and silty clayey sand. These soils are disturbed, have low strength characteristics, and are highly compressible when saturated.

Below the loose surface soils, approximately 2 to 3 feet of loose to very dense silty sand, silty sand with trace clay, silty clayey sand and silty sand/sandy silt were encountered. Some of these soils were weakly cemented in parts. Field and laboratory tests suggest that these soils are moderately strong and slightly compressible. The clayey soils have a low potential for expansion. Penetration resistance ranged from 13 to 57 blows per foot. Dry densities ranged from 91 to 119 pcf. Representative soil samples consolidated approximately 1 and 2 percent under a 2 ksf load when saturated. Representative soil samples had angles of internal friction of 29 and 37 degrees. Representative samples of the clayey soils had expansion indices of 3 and 5.

Below 2½ to 8 feet in several of the borings, a very dense weakly cemented silty sand, locally referred to as hardpan, was encountered. The cemented nature of the subsoil hampered recovery of undisturbed soil samples. However, these cemented soils can be generally characterized as relatively strong, slightly compressible, and have a low permeability. Penetration resistance was generally greater than 50 blows per 6 inches. These soils had similar strength characteristics as the upper soils.

Below 3 to 4 feet in the majority of the borings, alternating layers of predominately medium dense to very dense silty sand, silty sand with trace clay, clayey sand, silty sand/sand or sand were encountered. Field and laboratory tests suggest that these soils had similar strength characteristics as the upper soils. Penetration resistance ranged from 15 blows per foot to greater than 50 blows per 6 inches. Dry densities ranged from 86 to 129 pcf. These soils extended to the termination depth of our borings.

For additional information about the soils encountered, please refer to the boring logs in Appendix A.

GROUNDWATER

Test boring locations were checked for the presence of groundwater during and immediately following the drilling operations. Free groundwater was not encountered.

Cemented silty sand and silty sand with trace clay, locally referred to as "hardpan," were encountered below 2½ to 8 feet in several of the borings. This cementation retards the free percolation of the surface water into the soil stratum below the hardpan frequently resulting in a temporary perched water table condition at or near the ground surface.

It should be recognized that water table elevations may fluctuate with time, being dependent upon seasonal precipitation, irrigation, land use and climatic conditions as well as other factors. Therefore, water level observations at the time of the field investigation may vary from those encountered during the construction phase of the project. The evaluation of such factors is beyond the scope of this report.

CONCLUSIONS AND RECOMMENDATIONS

Based on the findings of our field and laboratory investigations, along with previous geotechnical experience in the project area, the following is a summary of our evaluations, conclusions, and recommendations.

Administrative Summary

In brief, the subject site and soil conditions, with the exception of the loose surface soils, previous development, and existing development appear to be conducive to the development of the project. The surface soils have a loose consistency. These soils are disturbed, have low strength characteristics and are highly compressible when saturated. Accordingly, it is recommended that the surface soils be recompacted. This compaction effort should stabilize the surface soils and locate any unsuitable or pliant areas not found during our field investigation.

The on-site upper soils consist of silty sand, silty sand with trace clay, clayey sand, silty sand/sand and sand. The clayey soils appeared to have a low swell potential. The estimated swell pressures of the clayey soils may cause minor movement effecting slabs and possible stucco or similar brittle exterior finishes. To reduce potential soil movement, it is recommended the upper 12 inches of soil within slab-on-grade and exterior flatwork areas consist of non-expansive Engineered Fill. Preliminary testing indicates the on-site soils will be suitable for reuse as non-expansive Engineered Fill, provided they are cleansed of excessive organics and debris. During construction, it is recommended that additional tests be performed on the on-site soils to verify their physical and index properties.

Fill material was not encountered in our borings. However, fill may be encountered between the boring locations. It is anticipated fill soils will consist of silty sand, silty sand with trace clay and silty clayey sand. The thickness and extent of fill material was determined based on limited test borings and visual observation. Verification of the extent of fill should be determined during site grading. It is recommended that fill soils that have not been properly compacted and certified be excavated and recompacted. Prior to backfilling, the bottom of the excavation should be observed by Krazan & Associates, Inc. to verify no additional removal is required.

The site is presently occupied by an orchard. Tree removal operations should include roots greater than 1 inch in diameter. The resulting excavations should be backfilled with Engineered Fill compacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557.

Two rural residential developments and a maintenance shed are located within the site. Associated with these developments are buried structures such as utility lines, irrigation lines, drainage lines, septic systems and possible water wells. Demolition activities should include proper removal all buried structures. Water wells should be abandoned in accordance with county standards. The resulting excavations should be backfilled with Engineered Fill. It is suspected that demolition activities of the existing structures will disturbed the upper soils. Following demolition activities, it is recommended that the disturbed soils be removed and/or recompacted. Any buried structures or loosely backfilled excavations encountered during construction should be properly removed and the resulting excavations backfilled with Engineered Fill. Disturbed areas caused by demolition activities should be recompacted.

Cemented silty sand and silty sand with clay, locally referred to as hardpan, were encountered below 2½ to 8 feet in some of the borings. Hardpan is an excellent foundation-bearing material because of its apparent rock-like properties caused by particle cementation. However, this same cementation also retards the free percolation of the surface water into the soil stratum below the hardpan, frequently resulting in a temporary perched water table condition at or near the ground surface. This perched water condition has a substantial affect on the strength characteristics of the surface soils. As a mitigation measure, very positive drainage should be established around the proposed structures.

Relatively clean sands were encountered at various locations throughout the site. The possibility exists that site grading operations could expose these soils in areas of proposed buildings, pavements, and/or retaining walls. The Contractor should note that these soils lack the cohesion necessary to stand vertically, even in shallow excavations such as footing trenches. If these conditions are encountered, it will be necessary to over-excavate the affected area(s) to a minimum of 2 feet below the proposed bearing surface. These areas may be backfilled using a mix of the silty sand and sand soils that contains at least 20 percent fines and meeting the requirements for Engineered Fill. This material may be obtained from elsewhere at the site, imported to the site from an approved off-site source, or manufactured through blending of the excavated clean sand with other suitable material containing a higher percentage of fines to result in material meeting the requirements for Engineered Fill.

After completion of the recommended site preparation, the site should be suitable for shallow footing support. The proposed structure footings may be designed utilizing an allowable bearing pressure of 2,000 psf for dead-plus-live loads. Footings should have a minimum embedment of 12 inches.

Groundwater Influence on Structures/Construction

Although groundwater was not encountered during our field investigation or anticipated to rise within the zone of structural influence within the project area, it is common for surface runoff water to infiltrate the upper sandy soils and perch above the underlying lower permeable hardpan for extended periods during the winter and spring months. This condition, if encountered, could seriously impede grading by causing an unstable subgrade condition. Typical remedial measures include discing and aerating the soils during soil during dry weather, mixing the soil with dryer materials, removing and replacing the soil with an approved fill material, or mixing the soil with an approved lime or cement product. Our firm should be consulted prior to implementing remedial measures to observe the unstable subgrade conditions and provide appropriate recommendations.

Some structures in the Clovis area are founded on hardpan have experienced standing water for extended periods of time in crawl spaces below wooden floors or within sunken floor slab areas. The sources of the water were natural precipitation and landscape irrigation, and consequently, wood floor and sunken floor slab construction in hardpan soils are discouraged.

Site Preparation

General site clearing should include removal of vegetation; existing utilities; concrete structures including foundations; basement walls and floors; existing stockpiled soil; trees and associated root systems; rubble; rubbish; and any loose and/or saturated materials. Site stripping should extend to a minimum depth of 2 to 4 inches, or until all organics in excess of 3 percent by volume are removed. Deeper stripping may be required in localized areas. These materials will not be suitable for use as Engineered Fill. However, stripped topsoil may be stockpiled and reused in landscape or non-structural areas.

Fill material was not encountered in our borings. However, fill may be encountered between the boring locations. It is anticipated fill soils will consist of silty sand and sandy silt. The thickness and extent of fill material was determined based on limited test borings and visual observation. Verification of the extent of fill should be determined during site grading. It is recommended that fill soils that have not been properly compacted and certified be excavated and recompacted. Prior to backfilling, the bottom of the excavation should be observed by Krazan & Associates, Inc. to verify no additional removal is required.

The site is presently occupied by two rural residential developments with associated barns and sheds. Associated with these developments are buried structures, such as utility lines, irrigation lines, septic systems, and water wells. Demolition activities should include proper removal of any buried structures. Any buried structures or loosely backfilled excavations encountered during construction should be properly removed and the resulting excavations backfilled. Excavations, depressions, or soft and pliant areas extending below planned finish subgrade level should be cleaned to firm undisturbed soil, and backfilled with Engineered Fill. In general, any septic tanks, debris pits, cesspools, or similar structures should be entirely removed. Concrete footings should be removed to an equivalent depth of at least 3 feet below proposed footing elevations or as recommended by the Soils Engineer. Water wells should be abandoned in accordance with county standards. Any other buried structures should be removed in accordance with the recommendations of the Soils Engineer. Resulting excavations should be backfilled with Engineered Fill.

The site is presently occupied by an orchard. Tree removal operations should include roots greater than 1 inch in diameter. The resulting excavations should be backfilled with Engineered Fill compacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557.

Following stripping, fill removal, tree removal, and demolition activities, the exposed subgrade within proposed building, exterior flatwork, and pavement areas should be excavated/scarified to a depth of at least 12 inches, worked until uniform and free from large clods, moisture-conditioned as necessary, and recompacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557. Limits of recompaction should extend 5 feet beyond structural elements.

The on-site upper soils predominately consist of silty sand, silty sand with trace clay and silty clayey sand. The clayey soils appeared to have a low swell potential. The estimated swell pressures of the clayey soils may cause minor movement effecting slabs and possible stucco or similar brittle exterior finishes. To reduce potential soil movement, it is recommended the upper 12 inches of soil within slab-on-grade and exterior flatwork areas consist of non-expansive Engineered Fill. Preliminary testing indicates the on-site soils will be suitable for reuse as non-expansive Engineered Fill, provided they are cleansed of excessive organics and debris. During construction, it is recommended that additional tests be performed on the on-site soils to verify their physical and index properties.

The upper soils, during wet winter months, become very moist due to the absorptive characteristics of the soil. Earthwork operations performed during winter months may encounter very moist unstable soils, which may require removal to grade a stable building foundation. Project site winterization consisting of placement of aggregate base and protecting exposed soils during the construction phase should be performed.

A representative of our firm should be present during all site clearing and grading operations to test and observe earthwork construction. This testing and observation is an integral part of our service as acceptance of earthwork construction is dependent upon compaction of the material and the stability of the material. The Soils Engineer may reject any material that does not meet compaction and stability requirements. Further recommendations of this report are predicated upon the assumption that earthwork construction will conform to recommendations set forth in this section and the Engineered Fill section.

Engineered Fill

The on-site, native and fill soils are predominately silty sand, silty sand with trace clay, clayey sand, silty sand/sand and sand. These soils will be suitable for reuse as Engineered Fill, provided they are cleansed of excessive organics and debris. Soils with an expansion index greater than 15 will not be suitable for reuse as non-expansive Engineered Fill and shouldn't be used in the upper 12 inches of slab-on-grade and exterior flatwork areas. These soils may be used for General Engineered Fill within non-structural areas, paved areas, and within slab-on-grade and exterior flatwork areas below 12 inches from finished pad grade, provided they are cleansed of excessive organics and debris. Clayey soils should be moisture-conditioned to at least 2 percent above optimum moisture content during placement. During construction it is recommended that additional tests be performed on the on-site soils to verify their physical and index properties.

Relatively clean sands were encountered at various locations throughout the site. The possibility exists that site grading operations could expose these soils in areas of proposed buildings, pavements, and/or retaining walls. The Contractor should note that these soils lack the cohesion necessary to stand vertically, even in shallow excavations such as footing trenches. If these conditions are encountered, it will be necessary to over-excavate the affected area(s) to a minimum of 2 feet below the proposed bearing surface. These areas may be backfilled using a mix of the silty sand and sand soils that contains at least 20 percent fines and meeting the requirements for Engineered Fill. This material may be obtained from elsewhere at the site, imported to the site from an approved off-site source, or manufactured through blending of the excavated clean sand with other suitable material containing a higher percentage of fines to result in material meeting the requirements for Engineered Fill.

The preferred materials specified for Engineered Fill are suitable for most applications with the exception of exposure to erosion. Project site winterization and protection of exposed soils during the construction phase should be the sole responsibility of the Contractor, since he has complete control of the project site at that time.

Imported Fill should consist of a well-graded, slightly cohesive, fine silty sand or sandy silt, with relatively impervious characteristics when compacted. This material should be approved by the Soils Engineer prior to use and should typically possess the following characteristics:

Percent Passing No. 200 Sieve	20 to 50
Plasticity Index	10 maximum
UBC Standard 29-2 Expansion Index	15 maximum

Fill soils should be placed in lifts approximately 6 inches thick, moisture-conditioned as necessary, and compacted to achieve at least 90 percent of maximum density based on ASTM D1557. Additional lifts should not be placed if the previous lift did not meet the required dry density or if soil conditions are not stable.

Drainage and Landscaping

The ground surface should slope away from building pad and pavement areas toward appropriate drop inlets or other surface drainage devices. In accordance with Section 1804 of the 2016 California Building Code, it is recommended that the ground surface adjacent to foundations be sloped a minimum of 5 percent for a minimum distance of 10 feet away from structures, or to an approved alternative means of drainage conveyance. Swales used for conveyance of drainage and located within 10 feet of foundations should be sloped a minimum of 2 percent. Impervious surfaces, such as pavement and exterior concrete flatwork, within 10 feet of building foundations should be sloped a minimum of 1 percent away from the structure. Drainage gradients should be maintained to carry all surface water to collection facilities and off-site. These grades should be maintained for the life of the project.

Slots or weep holes should be placed in drop inlets or other surface drainage devices in pavement areas to allow free drainage of adjoining base course materials. Cutoff walls should be installed at pavement edges adjacent to vehicular traffic areas, these walls should extend to a minimum depth of 12 inches below pavement subgrades to limit the amount of seepage water that can infiltrate the pavements. Where cutoff walls are undesirable subgrade drains can be constructed to transport excess water away from planters to drainage interceptors. If cutoff walls can be successfully used at the site, construction of subgrade drains is considered unnecessary.

Utility Trench Backfill

Utility trenches should be excavated according to accepted engineering practice following OSHA (Occupational Safety and Health Administration) standards by a Contractor experienced in such work. The responsibility for the safety of open trenches should be borne by the Contractor. Traffic and vibration adjacent to trench walls should be reduced and cyclic wetting and drying of excavation side slopes should be avoided. Depending upon the location and depth of some utility trenches, groundwater flow into open excavations could be experienced, especially during or shortly following periods of precipitation.

Sandy soil conditions were encountered at the site. These cohesionless soils have a tendency to cave in trench wall excavations. Shoring or sloping back trench sidewalls may be required within these sandy soils.

Utility trench backfill placed in or adjacent to buildings and exterior slabs should be compacted to at least 90 percent of maximum density based on ASTM Test Method D1557. The utility trench backfill placed in pavement areas should be compacted to at least 90 percent of maximum density based on ASTM Test Method D1557. Pipe bedding should be in accordance with pipe manufacturer's recommendations.

The Contractor is responsible for removing all water sensitive soils from the trench regardless of the backfill location and compaction requirements. The Contractor should use appropriate equipment and methods to avoid damage to the utilities and/or structures during fill placement and compaction.

Foundations

The proposed structures may be supported on a shallow foundation system bearing on undisturbed native soil or on Engineered Fill. Spread and continuous footings can be designed for the following maximum allowable soil bearing pressures:

Load	Allowable Loading
Dead Load Only	1,500 psf
Dead-Plus-Live Load	2,000 psf
Total Load, including wind or seismic loads	2,650 psf

The footings should have a minimum depth of 12 inches below pad subgrade (soil grade) or adjacent exterior grade, whichever is lower. Footings should have a minimum width of 12 inches, regardless of load.

The footing excavations should not be allowed to dry out at any time prior to pouring concrete. It is recommended that all footings be reinforced by at least one No. 4 reinforcing bar in both top and bottom.

The total movement is not expected to exceed 1 inch. Differential movement should be less than 1 inch. Most of the settlement is expected to occur during construction as the loads are applied. However, additional post-construction settlement may occur if the foundation soils are flooded or saturated.

Resistance to lateral footing displacement can be computed using an allowable friction factor of 0.35 acting between the base of foundations and the supporting subgrade. Lateral resistance for footings can alternatively be developed using an allowable equivalent fluid passive pressure of 325 pounds per cubic foot acting against the appropriate vertical footing faces. The frictional and passive resistance of the soil may be combined without reduction in determining the total lateral resistance. A ⅓ increase in the above value may be used for short duration, wind, or seismic loads.

Floor Slabs and Exterior Flatwork

The 2010 California Residential Code (CRC) Section R506.2.3 specifies that "a 6 mil polyethylene or *approved* vapor retarder with joints lapped not less than 6 inches shall be placed between the concrete floor slab and the base course or the prepared subgrade where no base course exists." Prior to adoption of this code section, traditional construction practice in the Fresno/Clovis area was to place an additional layer of sand or rock dust (per American Concrete Institute) to act as a blotting layer between the vapor retarder and the underside of the concrete slab. This blotting layer acted not only to protect the vapor barrier from punctures or tears during construction, but also served to promote even curing of the concrete slab. In the semi-arid climate of the Fresno/Clovis area, placement of the vapor retarder directly beneath the concrete slab has been known to result in rapid curing of the upper slab surface, especially during periods of elevated temperatures and/or sustained wind, as compared to the lower slab surface. Uneven curing of the upper and lower slab surfaces can result in excessive slab cracking and/or slab curling.

Based on our conversations, it is our understanding that Wilson Homes has developed a standard design for residential interior concrete slab-on-grade floors. The design incorporates a 2-inch layer of sand as a capillary break over the compacted subgrade soil. The sand layer is overlain by a layer of 10-mil PVC vapor retarder membrane, which is overlain by a 2-inch layer of sand, and finally by a minimum 3½-inch thick concrete slab. This system has reportedly been utilized by Wilson Homes with success in the past and has resulted in adequate performance of interior flooring materials.

It is recommended that the concrete slabs be reinforced at a minimum with #3 bars at 24 inches on center to reduce crack separation and possible vertical offset at the cracks. Thicker floor slabs with increased concrete strength and reinforcement should be designed wherever heavy concentrated loads, heavy equipment, or machinery is anticipated.

After reviewing Wilson Homes' standard design for residential interior concrete slab-on-grade floors for use in the Fresno/Clovis area, it is our opinion that this design, while deviating from Section R506.2.3 of the 2010 CRC, is an acceptable equivalent alternative to the criteria specified in the 2010 CRC. Based on our recommendation, Krazan & Associates requests that the local building official, i.e., City of Clovis, allow this standard design to be utilized for the subject residential tract.

Because this standard design does potentially allow for excessive moisture to be contained in the upper sand or rock dust layer from either rainfall or excessive moistening prior to pouring the slab, Krazan & Associates recommends that the upper sand layer be inspected prior to concrete placement to confirm that no ponding or standing water is present.

Lateral Earth Pressures and Retaining Walls

Walls retaining horizontal backfill and capable of deflecting a minimum of 0.1 percent of its height at the top may be designed using an equivalent fluid active pressure of 40 pounds per square foot per foot of depth. Walls incapable of this deflection or are fully constrained walls against deflection may be designed for an equivalent fluid at-rest pressure of 60 pounds per square foot per foot of depth. Expansive soils should not be used for backfill against walls. The wedge of non-expansive backfill material should extend from the bottom of each retaining wall outward and upward at a slope of 2:1 (horizontal to vertical) or flatter. The stated lateral earth pressures do not include the effects of hydrostatic water pressures generated by infiltrating surface water that may accumulate behind the retaining walls; or loads imposed by construction equipment, foundations, or roadways.

Retaining and/or below grade walls should be drained with either perforated pipe encased in free-draining gravel or a prefabricated drainage system. The gravel zone should have a minimum width of 12 inches wide and should extend upward to within 12 inches of the top of the wall. The upper 12 inches of backfill should consist of native soils, concrete, asphaltic concrete, or other suitable backfill to reduce surface drainage into the wall drain system. The aggregate should conform to Class 2 permeable materials graded in accordance with CalTrans Standard Specifications (2010). Prefabricated drainage systems, such as Miradrain®, Enkadrain®, or an equivalent substitute, are acceptable alternatives in lieu of gravel provided they are installed in accordance with the manufacturer's recommendations. If a prefabricated drainage system is proposed, our firm should review the system for final acceptance prior to installation.

Drainage pipes should be placed with perforations down and should discharge in a non-erosive manner away from foundations and other improvements. The pipes should be placed no higher than 6 inches above the heel of the wall, in the center line of the drainage blanket and should have a minimum diameter of four inches. Collector pipes may be either slotted or perforated. Slots should be no wider than ⅛ inch in diameter, while perforations should be no more than ¼ inch in diameter. If retaining walls are less than 6 feet in height, the perforated pipe may be omitted in lieu of weep holes on 4 feet maximum spacing. The weep holes should consist of 4-inch diameter holes (concrete walls) or unmortared head joints (masonry walls) and not be higher than 18 inches above the lowest adjacent grade. Two 8-inch square overlapping patches of geotextile fabric (conforming to CalTrans Standard Specifications for "edge drains") should be affixed to the rear wall opening of each weep hole to retard soil piping.

During grading and backfilling operations adjacent to any walls, heavy equipment should not be allowed to operate within a lateral distance of 5 feet from the wall, or within a lateral distance equal to the wall height, whichever is greater, to avoid developing excessive lateral pressures. Within this zone, only hand-operated equipment ("whackers," vibratory plates, or pneumatic compactors) should be used to compact the backfill soils.

R-Value Test Results and Pavement Design

Four subgrade soil samples were obtained from the project site for R-value testing at the locations shown on the attached site plan. The samples were tested in accordance with the State of California Materials Manual Test Designation 301. Results of the tests are as follows:

Sample	Depth	Description	R-Value at Equilibrium
1	12-24"	Silty Sand (SM)	51
2	12-24"	Silty Sand (SM)	45
3	12-24"	Silty Sand (SM)	59
4	12-24"	Silty Sand (SM)	43

The test results are moderate and indicate good subgrade support characteristics under dynamic traffic loads. The following table shows the recommended pavement sections for various traffic indices.

Traffic Index	Asphaltic Concrete	Class II Aggregate Base*	Compacted Subgrade**
4.0	2.0"	4.0"	12.0"
4.5	2.5"	4.0"	12.0"
5.0	2.5"	4.0"	12.0"
5.5	3.0"	4.0"	12.0"
6.0	3.0"	5.5"	12.0"
6.5	3.5"	5.5"	12.0"
7.0	4.0"	6.0"	12.0"
7.5	4.0"	7.0"	12.0"

**** 95% compaction based on ASTM Test Method D1557 or CAL 216***
***** 90% compaction based on ASTM Test Method D1557 or CAL 216***

If traffic indices are not available, an estimated (typical value) index of 4.5 may be used for light automobile traffic, and an index of 7.0 may be used for light truck traffic.

The following recommendations are for light-duty and heavy-duty Portland Cement Concrete Pavement Sections based on the design procedures developed by the Portland Cement Association.

PORTLAND CEMENT PAVEMENT
LIGHT DUTY

Traffic Index	Portland Cement Concrete***	Class II Aggregate Base*	Compacted Subgrade**
4.5	5.0"	--	12.0"

HEAVY DUTY

Traffic Index	Portland Cement Concrete***	Class II Aggregate Base*	Compacted Subgrade**
7.0	6.5"	--	12.0"

**** 95% compaction based on ASTM Test Method D1557 or CAL 216***
***** 90% compaction based on ASTM Test Method D1557 or CAL 216***
******Minimum compressive strength of 3000 psi***

It is recommended that any uncertified fill material encountered within pavement areas be removed and/or recompacted. The fill materials should be moisture-conditioned to near optimum moisture and recompacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557. As an alternative, the Owner may elect not to recompact the existing fill within paved areas. However, the Owner should be aware that the paved areas may settle which may require annual maintenance. At a minimum, it is recommended that the upper 12 inches of subgrade soil be moisture-conditioned to a minimum of 2 percent above optimum moisture content and recompacted to a minimum of 90 percent of maximum density based on ASTM Test Method D1557.

Seismic Parameters – 2016 California Building Code

The Site Class per Section 1613 of the 2016 California Building Code (2016 CBC) and Table 20.3-1 of ASCE 7-10 is based upon the site soil conditions. It is our opinion that a Site Class D is most consistent with the subject site soil conditions. For seismic design of the structures based on the seismic provisions of the 2016 CBC, we recommend the following parameters:

Seismic Item	Value	CBC Reference
Site Class	D	Section 1613.3.2
Site Coefficient F_a	1.345	Table 1613.3.3 (1)
S_s	0.568	Section 1613.3.1
S_{MS}	0.765	Section 1613.3.3
S_{DS}	0.510	Section 1613.3.4
Site Coefficient F_v	1.922	Table 1613.3.3 (2)
S_1	0.239	Section 1613.3.1
S_{M1}	0.459	Section 1613.3.3
S_{D1}	0.306	Section 1613.3.4

Soil Cement Reactivity

Excessive sulfate in either the soil or native water may result in an adverse reaction between the cement in concrete (or stucco) and the soil. HUD/FHA and UBC have developed criteria for evaluation of sulfate levels and how they relate to cement reactivity with soil and/or water.

Soil samples were obtained from the site and tested in accordance with State of California Materials Manual Test Designation 417. The sulfate concentrations detected in these soil samples were less than 0.02 percent and are below the maximum allowable values established by HUD/FHA and UBC. Therefore, no special design requirements are necessary to compensate for sulfate reactivity with the cement.

Compacted Material Acceptance

Compaction specifications are not the only criteria for acceptance of the site grading or other such activities. However, the compaction test is the most universally recognized test method for assessing the performance of the Grading Contractor. The numerical test results from the compaction test cannot be used to predict the engineering performance of the compacted material. Therefore, the acceptance of compacted materials will also be dependent on the stability of that material. The Soils Engineer has the option of rejecting any compacted material regardless of the degree of compaction if that material is considered to be unstable or if future instability is suspected. A specific example of rejection of fill material passing the required percent compaction is a fill which has been compacted with an in situ moisture content significantly less than optimum moisture. This type of dry fill (brittle fill) is susceptible to future settlement if it becomes saturated or flooded.

Testing and Inspection

A representative of Krazan & Associates, Inc. should be present at the site during the earthwork activities to confirm that actual subsurface conditions are consistent with the exploratory fieldwork. This activity is an integral part of our service, as acceptance of earthwork construction is dependent upon compaction testing and stability of the material. This representative can also verify that the intent of these recommendations is incorporated into the project design and construction. Krazan & Associates, Inc. will not be responsible for grades or staking, since this is the responsibility of the Prime Contractor.

LIMITATIONS

Soils Engineering is one of the newest divisions of Civil Engineering. This branch of Civil Engineering is constantly improving as new technologies and understanding of earth sciences advance. Although your site was analyzed using the most appropriate and most current techniques and methods, undoubtedly there will be substantial future improvements in this branch of engineering. In addition to advancements in the field of Soils Engineering, physical changes in the site, either due to excavation or fill placement, new agency regulations, or possible changes in the proposed structure after the soils report is completed may require the soils report to be professionally reviewed. In light of this, the Owner should be aware that there is a practical limit to the usefulness of this report without critical review. Although the time limit for this review is strictly arbitrary, it is suggested that 2 years be considered a reasonable time for the usefulness of this report.

Foundation and earthwork construction is characterized by the presence of a calculated risk that soil and groundwater conditions have been fully revealed by the original foundation investigation. This risk is derived from the practical necessity of basing interpretations and design conclusions on limited sampling of the earth. The recommendations made in this report are based on the assumption that soil conditions do not vary significantly from those disclosed during our field investigation. If any variations or undesirable conditions are encountered during construction, the Soils Engineer should be notified so that supplemental recommendations may be made.

The conclusions of this report are based on the information provided regarding the proposed construction. If the proposed construction is relocated or redesigned, the conclusions in this report may not be valid. The Soils Engineer should be notified of any changes so the recommendations may be reviewed and re-evaluated.

This report is a Geotechnical Engineering Investigation with the purpose of evaluating the soil conditions in terms of foundation design. The scope of our services did not include any Environmental Site Assessment for the presence or absence of hazardous and/or toxic materials in the soil, groundwater, or atmosphere; or the presence of wetlands. Any statements, or absence of statements, in this report or on any boring log regarding odors, unusual or suspicious items, or conditions observed, are strictly for descriptive purposes and are not intended to convey engineering judgment regarding potential hazardous and/or toxic assessment.

The geotechnical engineering information presented herein is based upon professional interpretation utilizing standard engineering practices and a degree of conservatism deemed proper for this project. It is not warranted that such information and interpretation cannot be superseded by future geotechnical engineering developments. We emphasize that this report is valid for the project outlined above and should not be used for any other sites.

If you have any questions or if we may be of further assistance, please do not hesitate to contact our office at (559) 348-2200.

Respectfully submitted,

APPENDIX A

FIELD AND LABORATORY INVESTIGATIONS

Field Investigation

The field investigation consisted of a surface reconnaissance and a subsurface exploratory program. Nineteen 4½-inch exploratory borings were advanced. The boring locations are shown on the site plan.

The soils encountered were logged in the field during the exploration and, with supplementary laboratory test data, are described in accordance with the Unified Soil Classification System.

Modified standard penetration tests were performed at selected depths. This test represents the resistance to driving a 2½-inch diameter core barrel. The driving energy was provided by a hammer weighing 140 pounds falling 30 inches. Relatively undisturbed soil samples were obtained while performing this test. Bag samples of the disturbed soil were obtained from the auger cuttings. All samples were returned to our Clovis laboratory for evaluation.

Laboratory Investigation

The laboratory investigation was programmed to determine the physical and mechanical properties of the foundation soil underlying the site. Test results were used as criteria for determining the engineering suitability of the surface and subsurface materials encountered.

In situ moisture content, dry density, consolidation, direct shear and sieve analysis tests were determined for the undisturbed samples representative of the subsurface material. Expansion index and R-value tests were completed for select bag samples obtained from the auger cuttings. These tests, supplemented by visual observation, comprised the basis for our evaluation of the site material.

The logs of the exploratory borings and laboratory determinations are presented in this Appendix.

AGENDA ITEM NO. 6.

UNIFIED SOIL CLASSIFICATION SYSTEM

UNIFIED SOIL CLASSIFICATION AND SYMBOL CHART

COARSE-GRAINED SOILS

(more than 50% of material is larger than No. 200 sieve size.)

GRAVELS More than 50% of coarse fraction larger than No. 4 sieve size	Clean Gravels (Less than 5% fines)		
	⁘	GW	Well-graded gravels, gravel-sand mixtures, little or no fines
	○	GP	Poorly-graded gravels, gravel-sand mixtures, little or no fines
	Gravels with fines (More than 12% fines)		
	▥	GM	Silty gravels, gravel-sand-silt mixtures
	▩	GC	Clayey gravels, gravel-sand-clay mixtures
SANDS 50% or more of coarse fraction smaller than No. 4 sieve size	Clean Sands (Less than 5% fines)		
	⁙	SW	Well-graded sands, gravelly sands, little or no fines
	∴	SP	Poorly graded sands, gravelly sands, little or no fines
	Sands with fines (More than 12% fines)		
	▥	SM	Silty sands, sand-silt mixtures
	▨	SC	Clayey sands, sand-clay mixtures

FINE-GRAINED SOILS

(50% or more of material is smaller than No. 200 sieve size.)

SILTS AND CLAYS Liquid limit less than 50%	▥	ML	Inorganic silts and very fine sands, rock flour, silty of clayey fine sands or clayey silts with slight plasticity
	▨	CL	Inorganic clays of low to medium plasticity, gravelly clays, sandy clays, silty clays, lean clays
	▤	OL	Organic silts and organic silty clays of low plasticity
SILTS AND CLAYS Liquid limit 50% or greater	▥	MH	Inorganic silts, micaceous or diatomaceous fine sandy or silty soils, elastic silts
	▨	CH	Inorganic clays of high plasticity, fat clays
	≋	OH	Organic clays of medium to high plasticity, organic silts
HIGHLY ORGANIC SOILS	⁂	PT	Peat and other highly organic soils

CONSISTENCY CLASSIFICATION

Description	Blows per Foot

Krazan Testing Laboratory

APPENDIX B

EARTHWORK SPECIFICATIONS

GENERAL

When the text of the report conflicts with the general specifications in this appendix, the recommendations in the report have precedence.

SCOPE OF WORK: These specifications and applicable plans pertain to and include all earthwork associated with the site rough grading, including but not limited to the furnishing of all labor, tools, and equipment necessary for site clearing and grubbing, stripping, preparation of foundation materials for receiving fill, excavation, processing, placement and compaction of fill and backfill materials to the lines and grades shown on the project grading plans, and disposal of excess materials.

PERFORMANCE: The Contractor shall be responsible for the satisfactory completion of all earthwork in accordance with the project plans and specifications. This work shall be inspected and tested by a representative of Krazan and Associates, Inc., hereinafter known as the Soils Engineer and/or Testing Agency. Attainment of design grades when achieved shall be certified to by the project Civil Engineer. Both the Soils Engineer and the Civil Engineer are the Owner's representatives. If the Contractor should fail to meet the technical or design requirements embodied in this document and on the applicable plans, he shall make the necessary readjustments until all work is deemed satisfactory as determined by both the Soils Engineer and the Civil Engineer. No deviation from these specifications shall be made except upon written approval of the Soils Engineer, Civil Engineer or project Architect.

No earthwork shall be performed without the physical presence or approval of the Soils Engineer. The Contractor shall notify the Soils Engineer at least 2 working days prior to the commencement of any aspect of the site earthwork.

The Contractor agrees that he shall assume sole and complete responsibility for job site conditions during the course of construction of this project, including safety of all persons and property; that this requirement shall apply continuously and not be limited to normal working hours; and that the Contractor shall defend, indemnify and hold the Owner and the Engineers harmless from any and all liability, real or alleged, in connection with the performance of work on this project, except for liability arising from the soil negligence of the Owner or the Engineers.

TECHNICAL REQUIREMENTS: All compacted materials shall be densified to a density not less that 90 percent relative compaction based on ASTM Test Method D1557-78, UBC or CAL-216, as specified in the technical portion of the Soil Engineer's report. The location and frequency of field density tests shall be as determined by the Soils Engineer. The results of these tests and compliance with these specifications shall be the basis upon which satisfactory completion of work will be judged by the Soils Engineer.

SOILS AND FOUNDATION CONDITIONS: The Contractor is presumed to have visited the site and to have familiarized himself with existing site conditions and the contents of the data presented in the soil report.

The Contractor shall make his own interpretation of the data contained in said report, and the Contractor shall not be relieved of liability under the Contractor for any loss sustained as a result of any variance between conditions indicated by or deduced from said report and the actual conditions encountered during the progress of the work.

DUST CONTROL: The work includes dust control as required for the alleviation or prevention of any dust nuisance on or about the site or the borrow area, or off-site if caused by the Contractor's operation either during the performance of the earthwork or resulting from the conditions in which the Contractor leaves the site. The Contractor shall assume all liability, including court costs of codefendants, for all claims related to dust or windblown materials attributable to his work.

SITE PREPARATION

Site preparation shall consist of site clearing and grubbing and the preparations of foundation materials for receiving fill.

CLEARING AND GRUBBING: The Contractor shall accept the site in this present condition and shall demolish and/or remove from the area of designated project, earthwork all structures, both surface and subsurface, trees, brush, roots, debris, organic matter, and all other matter determined by the Soils Engineer to be deleterious. Such materials shall become the property of the Contractor and shall be removed from the site.

Tree root systems in proposed building areas should be removed to a minimum depth of 3 feet and to such an extent which would permit removal of all roots larger than 1 inch. Tree root removed in parking areas may be limited to the upper 1½ feet of the ground surface. Backfill or tree root excavation should not be permitted until all exposed surfaces have been inspected and the Soils Engineer is present for the proper control of backfill placement and compaction. Burning in areas which are to receive fill materials shall not be permitted.

SUBGRADE PREPARATION: Surfaces to receive Engineered Fill, building or slab loads shall be prepared as outlined above, scarified to a depth of 6 inches, moisture-conditioned as necessary, and compacted to 90 percent relative compaction.

Loose soil areas, areas of uncertified fill, and/or areas of disturbed soils shall be moisture-conditioned as necessary and recompacted to 90 percent relative compaction. All ruts, hummocks, or other uneven surface features shall be removed by surface grading prior to placement of any fill materials. All areas, which are to receive fill materials, shall be approved by the Soils Engineer prior to the placement of any of the fill material.

EXCAVATION: All excavation shall be accomplished to the tolerance normally defined by the Civil Engineer as shown on the project grading plans. All over excavation below the grades specified shall be backfilled at the Contractor's expense and shall be compacted in accordance with the applicable technical requirements.

FILL AND BACKFILL MATERIAL: No material shall be moved or compacted without the presence of the Soils Engineer. Material from the required site excavation may be utilized for construction site fills provided prior approval is given by the Soils Engineer. All materials utilized for constructing site fills shall be free from vegetation or other deleterious matter as determined by the Soils Engineer.

PLACEMENT, SPREADING AND COMPACTION: The placement and spreading of approved fill materials and the processing and compaction of approved fill and native materials shall be the responsibility of the Contractor. However, compaction of fill materials by flooding, ponding, or jetting shall not be permitted unless specifically approved by local code, as well as the Soils Engineer.

Both cut and fill shall be surface compacted to the satisfaction of the Soils Engineer prior to final acceptance.

SEASONAL LIMITS: No fill material shall be placed, spread, or rolled while it is frozen or thawing or during unfavorable wet weather conditions. When the work is interrupted by heavy rains, fill operations shall not be resumed until the Soils Engineer indicates that the moisture content and density of previously placed fill are as specified.

APPENDIX C

PAVEMENT SPECIFICATIONS

1. **DEFINITIONS** - The term "pavement" shall include asphaltic concrete surfacing, untreated aggregate base, and aggregate subbase. The term "subgrade" is that portion of the area on which surfacing, base, or subbase is to be placed.

The term “Standard Specifications”: hereinafter referred to is the 2010 Standard Specifications of the State of California, Department of Transportation, and the "Materials Manual" is the Materials Manual of Testing and Control Procedures, State of California, Department of Public Works, Division of Highways. The term "relative compaction" refers to the field density expressed as a percentage of the maximum laboratory density as defined in the applicable tests outlined in the Materials Manual.

2. **SCOPE OF WORK** - This portion of the work shall include all labor, materials, tools, and equipment necessary for, and reasonably incidental to the completion of the pavement shown on the plans and as herein specified, except work specifically notes as "Work Not Included."

3. **PREPARATION OF THE SUBGRADE** - The Contractor shall prepare the surface of the various subgrades receiving subsequent pavement courses to the lines, grades, and dimensions given on the plans. The upper 12 inches of the soil subgrade beneath the pavement section shall be compacted to a minimum relative compaction of 90 percent. The finished subgrades shall be tested and approved by the Soils Engineer prior to the placement of additional pavement courses.

4. **UNTREATED AGGREGATE BASE** - The aggregate base material shall be spread and compacted on the prepared subgrade in conformity with the lines, grades, and dimensions shown on the plans. The aggregate base material shall conform to the requirements of Section 26 of the Standard Specifications for Class 2 material, 1½ inches maximum size. The aggregate base material shall be compacted to a minimum relative compaction of 95 percent. The aggregate base material shall be spread and compacted in accordance with Section 26 of the Standard Specifications. The aggregate base material shall be spread in layers not exceeding 6 inches and each layer of aggregate material course shall be tested and approved by the Soils Engineer prior to the placement of successive layers.

5. **AGGREGATE SUBBASE** - The aggregate subbase shall be spread and compacted on the prepared subgrade in conformity with the lines, grades, and dimensions shown on the plans. The aggregate subbase material shall conform to the requirements of Section 25 of the Standard Specifications for Class 2 material. The aggregate subbase material shall be compacted to a minimum relative compaction of 95 percent, and it shall be spread and compacted in accordance with Section 25 of the Standard Specifications. Each layer of aggregate subbase shall be tested and approved by the Soils Engineer prior to the placement of successive layers.

6. ASPHALTIC CONCRETE SURFACING - Asphaltic concrete surfacing shall consist of a mixture of mineral aggregate and paving grade asphalt, mixed at a central mixing plant and spread and compacted on a prepared base in conformity with the lines, grades and dimensions shown on the plans. The viscosity grade of the asphalt shall be PG 64-10. The mineral aggregate shall be Type B, ½ inch maximum size, medium grading and shall conform to the requirements set forth in Section 39. The drying, proportioning and mixing of the materials shall conform to Section 39.

The prime coat, spreading and compacting equipment and spreading and compacting mixture shall conform to the applicable chapters of Section 39, with the exception that no surface course shall be placed when the atmospheric temperature is below 50° F. The surfacing shall be rolled with a combination of steel wheel and pneumatic rollers, as described in Section 39-6. The surface course shall be placed with an approved self-propelled mechanical spreading and finishing machine.

7. FOG SEAL COAT - The fog seal (mixing type asphaltic emulsion) shall conform to and be applied in accordance with the requirements of Section 37.

RE: Phase I Environmental Site Assessment
Tract No. 6205 Property
Northeast corner of N. Sunnyside and E. Shepherd Avenues
Clovis, California 93619

Dear Mr. Harris:

Krazan & Associates, Inc., (Krazan) completed a Phase I Environmental Site Assessment at the referenced site summarized in a report dated January 14, 2019. We appreciate the opportunity to serve your environmental due diligence needs. During the course of this assessment, Krazan identified no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs) and historical RECs (HRECs) in conjunction with the subject site as defined by ASTM E 1527-13. However, the following potential areas of concern (PAOCs), non-scope issues and site development issues are presented:

PAOCs

- Adjacent to the north of the on-site warehouse and lined against its back wall, three approximately 250-gallon aboveground storage (AST) tanks were observed. Two ASTs contained diesel fuel and the third contained gasoline. Additionally, four 55-gallon drums containing motor oil were observed to be located to the west of the ASTs which exhibited *de minimis* staining. The site reconnaissance was completed a day following a heavy rain event and it was not clear if the ground surface below the ASTs and/or drums exhibited any significant petroleum product staining because the ground remained saturated with rainwater precluding visual observations. Consequently, the specific condition of the ground surface underlying the ASTs and drums is unknown.

  For a higher level of due diligence, Krazan recommends that a limited assessment be conducted in the area of the ASTs and drums to assess the presence or absence of potential significant impacts from constituents of concern.

- Krazan's review of aerial photographs indicates that the subject site was utilized for agricultural purposes from at least 1937 to the present and that residential structures and associated outbuildings occupied the property from at least 1937, 1979 and 1987 to the present. No records of USTs for the subject site are on file with the local regulatory agencies; however, USTs on rural or agricultural properties historically have been exempt from requirements for registration with regulatory agencies. Furthermore, Krazan's experience with such properties has shown that it was not uncommon for property owners/operators to install USTs for their convenience, especially in the vicinity of structures, which are undocumented and whose presence would remain unknown in spite of the standard data research conducted in the course of this Phase I ESA. It is therefore possible that subsurface features such as unregistered fuel USTs may exist within the structure-related portions of the subject site which remain unknown based on the absence of any regulatory, municipality, and/or interview data, or other evidence indicating their presence or location. Consequently, despite an absence of data suggesting their presence, the presence or absence of USTs associated with on-site structures in a historical agricultural setting on the subject site is unknown.

For a higher level of due diligence, Krazan recommends that a limited geophysical survey be conducted in the areas of the structures located on the subject site to assess the presence or absence of subsurface metallic anomalies characteristic of underground storage tanks or other subsurface features of concern.

NON-SCOPE ISSUES

- The residential dwellings/structures located on the subject site appears to have been originally constructed in at least 1937, 1979 and 1987. It is unknown if the on-site dwellings/structures contain asbestos-containing materials (ACMs) or lead-based paint (LBP). An asbestos and/or LBP survey and sampling of the on-site dwellings/structures was not included within the scope of this assessment. However, based upon the approximate apparent dates of construction, ACMs and LBP may be present at the subject site. During Krazan’s site reconnaissance, no damaged building materials which appeared to be posing a health hazard were noted within those areas of the on-site residential dwellings/structures observed. Prior to the disturbance of any of the suspect ACMs or LBP at the subject site via renovation or demolition, a comprehensive asbestos and LBP survey designed to determine if the suspect ACM and LBP are regulated materials is recommended. If such materials are identified and need to be disturbed, repaired, or removed, a licensed abatement contractor should be consulted.

SITE DEVELOPMENT ISSUES

- Based on Krazan’s historical research and interviews, two domestic water wells and five agricultural water wells were observed to be associated with the subject site. If the on-site water wells are not to be used in the future, they should be properly abandoned/destroyed in accordance with state and local guidelines.

If you have any questions regarding the information presented in this report, please call me at (559) 348-2200.

Respectfully Submitted,
KRAZAN & ASSOCIATES, INC.

PHASE I ENVIRONMENTALSITE ASSESSMENT
TRACT NO. 6205 PROPERTY
NORTHEAST CORNER OF N. SUNNYSIDE AND E. SHEPHERD AVENUES
CLOVIS, CALIFORNIA 93619

1.0 EXECUTIVE SUMMARY

Krazan & Associates, Inc. (Krazan) has conducted a Phase I Environmental Site Assessment (ESA) of the Tract No. 6205 Property located on the northeast corner of North Sunnyside and East Shepherd Avenues in Clovis, California 93619 (subject site). It is incumbent upon the user to read this Phase I ESA report in its entirety. If not otherwise defined within the text of this report, please refer to the Glossary of Terms Section following the References Section for definitions of terms and acronyms utilized within this Phase I ESA report. Krazan conducted the Phase I ESA of the subject site in conformance with the American Society for Testing and Materials (ASTM) E 1527-13 *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process.* This Phase I ESA constitutes all appropriate inquiry (AAI) designed to identify recognized environmental conditions (RECs) in connection with the previous ownership and uses of the subject site as defined by ASTM E 1527-13.

ASTM E 1527-13 Section 1.1.1 *Recognized Environmental Conditions* – In defining a standard of good commercial and customary practice for conducting an environmental site assessment of a parcel of property, the goal of the processes established by this practice is to identify recognized environmental conditions. The term recognized environmental conditions means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not recognized environmental conditions.

During the course of this assessment, Krazan identified no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs) or historical RECs (HRECs) in conjunction with the subject site as defined by ASTM E 1527-13. However, potential areas of concern (PAOCs) were revealed related to structures located on the property over the course of historical agricultural use which potentially may have incorporated underground storage tanks (USTs) and the condition of the ground surface underlying on-site fuel aboveground storage tanks (ASTs) and 55-gallon drums. Please refer to Section 8.0 for a discussion of these issues along with non-scope issues and site development issues.

2.0 PURPOSE AND SCOPE OF ASSESSMENT

2.1 Purpose

According to ASTM E 1527-13, the purpose of this practice is to define good commercial and customary practice in the United States of America for conducting an *environmental site assessment* of a parcel of *commercial real estate* with respect to the range of contaminants within the scope of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) (42 U.S.C. §9601) and *petroleum products.* As such, this practice is intended to permit a *user* to satisfy one of the requirements to qualify for the *innocent landowner, contiguous property owner,* or *bona fide prospective purchaser* limitation on CERCLA liability (hereinafter, the *landowner liability protections,* or *LLPs*): that is, the practice that constitutes *all appropriate inquiries* into the previous ownership and uses of the *property* consistent with good commercial and customary practice as defined at 42 U.S.C. §9601(35)(B).

2.2 Scope of Work

The Phase I ESA includes the following scope of work: a) a site reconnaissance of existing on-site conditions and observations of adjacent property uses, b) a review of user-provided documents, c) a review of historical aerial photographs, a review of pertinent building permit records, city directories, historical Sanborn Fire Insurance Maps (SFIMs), and interview(s) with person(s) knowledgeable of the previous and current ownership and uses of the subject site, d) a review of local regulatory agency records, and e) a review of local, state, and federal regulatory agency lists compiled by Environmental Data Resources, Inc. (EDR). The scope of work for this Phase I ESA conforms to ASTM E 1527-13. Krazan was provided written authorization to conduct the Phase I ESA by Mr. Jeffrey Harris, Chief Operating Officer with Wilson Homes, on December 13, 2018 in Krazan's December 10, 2018 Proposal/Cost Estimate No. P18-403.

3.0 SITE DESCRIPTION

The subject site is located on the northeast corner of North Sunnyside and East Shepherd Avenues within the City of Clovis, California. General property information and property use are summarized in the following Table I. Refer to Figures No. 1 – 4 following the Reference Section.

TABLE I
Subject Site Information Summary

Current Owner:	Leo Wilson
Assessor's Parcel Number:	557-021-19, -20, and -21
Address:	N/A
Historical Address:	5230 East Shepherd Avenue Clovis, CA 93619
General Location:	Northeast of N. Sunnyside and E. Shepherd Avenues
Acreage:	75.05 acres
Existing Use:	Residential/Agricultural
Number of Structures:	Four
Original Construction Date:	At least 1937
Proposed Use:	Residential Development
Topographic Map:	U.S. Geological Survey, 7.5 minute Clovis, California topographic quadrangle map, dated 1964, photorevised 1981
Topographic Map Location:	Southwest quarter of Section 21, Township 12 South, Range 21 East, Mount Diablo Baseline and Meridian
Latitude/Longitude:	36.8685° / –119.690752°
Topography:	Relatively flat, approximately 385 feet above mean sea level
Approximate Depth to Groundwater:	55-65 feet below ground surface (bgs), State of California Department of Water Resources (DWR)*
Regional Groundwater Flow Direction:	Southwest, DWR

* State of California, Department of Water Resources, *Lines of Equal Elevation of Water in Wells Unconfined Aquifer, San Joaquin Valley, Spring 2010*.

3.1 Geology and Hydrogeology

The subject site is located within the San Joaquin Valley, a broad structural trough bound by the Sierra Nevada and Coast Ranges of California. The San Joaquin Valley, which comprises the southern portion of the Great Valley of California, has been filled with several thousand feet of sedimentary deposits. Sediments in the eastern valley, derived from the erosion of the Sierra Nevada, have been deposited by major to minor west-flowing drainages and their tributaries. Near-surface sediments are dominated by sands and silty sands with lesser silts, minor clays, and gravel. The sedimentary deposits in the region form large coalescing alluvial fans with gentle slopes. The groundwater in the area is reported to be first encountered at a depth of approximately 55-65 feet bgs. The groundwater flow direction in the area of the subject site is generally towards the southwest.

4.0 SITE RECONNAISSANCE

A site reconnaissance, which included a visual observation of the subject site and surrounding properties, was conducted by Ms. Michelle Phillips, Krazan's Environmental Assessor, on January 10, 2019. Krazan's Environmental Assessor was unaccompanied during the site reconnaissance. The objective of the site reconnaissance is to obtain information indicating the likelihood of identifying recognized environmental conditions, including hazardous substances and petroleum products, in connection with the property (including soils, surface waters, and groundwater).

4.1 Observations

The following Table II summarizes conditions encountered during our site reconnaissance. A discussion of visual observations follows Table II. Refer to the Site Map (Figure No. 3) and color photographs following the text for the locations of items discussed in this section of the report.

TABLE II
Summary of Site Reconnaissance

Feature	Observed	Not Observed
Structures (existing)	X	
Evidence of Past Uses (foundations, debris)		X
Hazardous Substances and/or Petroleum Products (including containers)	X	
Aboveground Storage Tanks (ASTs)	X	
Underground Storage Tanks (USTs) or Evidence of USTs		X
Evidence of Underground Pipelines		X
Strong, Pungent, or Noxious Odors		X
Pools of Liquid Likely to be Hazardous Materials or Petroleum Products		X
Drums	X	
Unidentified Substance Containers	X	
Potential Polychlorinated Biphenyl (PCB)-Containing Equipment	X	
Subsurface Hydraulic Equipment		X
Heating/Ventilation/Air conditioning (HVAC)	X	
Stains or Corrosion on Floors, Walls, or Ceilings	X	
Floor Drains, Sumps, or Oil/Water Clarifiers		X
Storm Drains	X	
Pits, Ponds, or Lagoons		X
Stained Soil and/or Pavement		X
Soil Piles		X
Stressed Vegetation		X
Waste or Wastewater (including stormwater) Discharges to Surface/ Surface Waters		X
Wells (irrigation, domestic, dry, injection, abandoned, monitoring wells)	X	
Septic Systems		X

The subject site comprises approximately 75.05 acres of rural residential property with the associated Fresno County APNs of 557-021-19, -20 and -21. The subject site is currently occupied by three residential dwellings and a warehouse. The remainder of the subject site is currently occupied by a pecan orchard (See Photographs No. 1 – 58). Refer to Figure No. 3, Site Map, and related photographs for locations and depictions of the following referenced on-site features:

- A rural residential dwelling with the associated subject site address of 5230 East Shepherd Avenue was observed within the southern portion of the subject site. A domestic water well was observed adjacent to the west of the rural residential dwelling (See Photographs No. 11 – 17).

- Adjacent to the north of the rural residential dwelling was a large warehouse where pecans are dried, packed and shipped. The warehouse was observed to be a steel structure set upon a slab on grade foundation. Large cracks were observed in the concrete foundation. *De minimis* staining was also observed on the foundation. Inside the warehouse were observed multiple pallets of stacked and bagged product, a forklift, several empty pallets, at least three refrigerators, and a ladder. A small storage room and two restrooms were also observed in the warehouse. The storage room was observed to contain a generator, at least three boxes of Roundup® herbicide, and multiple bags of zinc sulfate fertilizer. A small shop area was observed in the northeastern portion of the warehouse and contained multiple various tools and two compressed gas cylinders. The type of gas contained was no longer legible on the cylinders (See Photographs No. 18 – 21, 29).

- The warehouse had a bay attached to the eastern side and observed within the bay were a large electric heater for drying pecans, a concrete-lined subsurface pit that is used to dry the pecans, and at least eight metal access panels for the pit. No evidence of petroleum products was observed within or near the pit. *De minimis* staining was observed on the motor of the electric heater (See Photographs No. 26 – 28).

- Adjacent to the north of the warehouse and lined against its back wall were observed three approximately 250-gallon aboveground storage (AST) tanks. Two ASTs contained diesel fuel and the third contained gasoline. The site reconnaissance was completed a day following a heavy rain event and it was not clear if the ground surface below the ASTs exhibited any petroleum product staining because the ground remained saturated with rainwater precluding visual observations (See Photographs No. 22 – 25). A propane tank and stack of firewood were observed adjacent to the north of the ASTs (See Photograph No. 31).

- Four 55-gallon drums containing motor oil were observed to be located to the west of the ASTs. The drums exhibited *de minimis* staining. Also observed adjacent to the drums were two trash bins, a shopping cart and a tire (See Photograph No. 30).

- At least seven utility vaults were observed to be located on the southern boundary along E. Shepherd Avenue (See Photograph No. 11, 52).

- Four pole-mounted transformers were observed on the subject site. Two of the pole-mounted transformers were observed to be located in the central-eastern portion of the subject site, and two were observed to be located along the eastern boundary on the southern portion of the subject site. The transformer casings displayed no visual evidence of leakage and the ground surface below the transformers displayed no evidence of discoloration. Based on Krazan's observations, the Pacific Gas & Electric (PG&E) Company is the owner of the transformers. The transformers were not labeled as to their polychlorinated biphenyl (PCB) status. Based on the visual absence of apparent unauthorized releases of insulating fluids from the transformers at the time of Krazan's site reconnaissance, the transformers are not currently anticipated to pose an adverse impact to the subject site. However, in the event of a future release/leak of insulating fluids from the transformers, PG&E should be contacted regarding the testing of the transformers for PCB fluids or for their removal/replacement (See Photographs No. 9, 38, 40, 58).

- A small residential structure was observed to be located in the central-eastern portion of the subject site. Access was not granted to the structure at the time of the site reconnaissance because a trailer was parked up against the building, blocking the only entrance to the structure. Additionally, the three windows observed were all too frosted to allow observation of the interior. Multiple items were stored around the structure (See Photographs No. 34 – 37):
    - On the western side was stored an old satellite dish, a pile of concrete debris, a flatbed trailer, and farming equipment;
    - On the southern side was stored a pile of railroad ties, old chain-link fencing, a ladder and farming equipment; and,
    - On the eastern side was stored two trailers, multiple bales of chain link fencing, several stacks of tires and a portable water tank on a trailer.
- Five agricultural water wells were observed to be located on the subject site, two located along the east-west centerline of the subject site to the east of the small residential structure previously mentioned, one located in the southwestern corner of the subject site, one located in the northwestern corner of the subject site, and one located along the eastern boundary of the subject site (See Photographs No. 6, 33 – 34, 37 – 39, 41, and 53).
- A rural residential dwelling was observed within the northwestern portion of the subject site. A domestic water well and associated water tank was observed adjacent to the west of the rural residential dwelling (See Photographs No. 6 – 7, 42 – 49).
- Two large berms containing wood branches and debris from pruning the orchard were observed along the eastern boundary of the subject site. The berms were at least 10-12 feet tall. The larger of the two berms was approximately 550 feet in length, and the smaller was approximately 80 feet in length. The smaller of the two berms appears to be mainly chopped wood. It is unknown how long the berms have been there, and what the condition of the ground is below the berms. Additionally, three flatbed trailers were observed to be located adjacent to the smaller berm (See Photographs No. 50 – 51, 54 – 57).
- During the visual observations of the subject site, no hazardous materials were observed. Exposed surface soils did not exhibit obvious signs of discoloration in accessible areas. No obvious evidence (vent pipes, fill pipes, dispensers, etc.) of USTs was noted within the areas observed. No standing water or major depressions were observed on the subject site. No indications of former structures, such as foundations, were observed on the subject site.
- No high-voltage, tower-mounted electrical transmission lines were observed on or in the vicinity of the subject site.

4.2 Utilities

Based on Krazan's research, the following Table III summarizes companies/municipalities that currently provide or will provide utility services to the subject site:

TABLE III
Municipal Service / Utility Providers

Electricity	Pacific Gas & Electric Company
Natural Gas	Pacific Gas & Electric Company
Potable Water	Domestic Water Well
Sanitary Sewer	City of Clovis

Upon future development, the City of Clovis will provide water services to the subject site.

4.3 Adjacent Streets and Property Usage

The following Table IV summarizes the current adjacent roads and adjacent property uses observed during the site reconnaissance.

TABLE IV
Adjacent Streets and Property Use

Direction	Adjacent Street	Adjacent Property Use (Address)
North	None	Residential
South	E. Shepherd Avenue	Residential
East	None	Residential
West	N. Sunnyside Avenue	Agricultural

Based on the observed uses of the properties located immediately adjacent to the subject site, it is unlikely that significant quantities of hazardous materials are stored at the adjacent properties.

4.4 ASTM Non-Scope Considerations

According to ASTM E 1527-13, there may be environmental issues or conditions at the subject site that are outside the scope of the Phase I ESA practice (non-scope considerations). Some substances may be present at the subject site in quantities and under conditions that may lead to contamination of the subject site or of nearby properties but are not included in CERCLA’s definition of hazardous substances (42 U.S.C. §9601[14]). ASTM non-scope considerations are discussed below.

Asbestos-Containing Materials

Asbestos is a group of naturally occurring mineral fibers that have been used commonly in a variety of building construction materials for insulation and as a fire-retardant. Because of its fiber strength and heat resistant properties, asbestos has been used for a wide range of manufactured goods, mostly in building materials, vehicle brakes, and heat-resistant fabrics, packaging, gaskets, and coatings. When asbestos-containing materials (ACMs) are damaged or disturbed by repair, remodeling, or demolition activities, microscopic asbestos fibers may become airborne and can be inhaled into the lungs, where they can cause significant health problems.

The residential structures located on the subject site were constructed in at least 1937, 1979 and 1987. It is unknown if the on-site structures contain ACMs. An asbestos survey and sampling of the on-site structures was not included within the scope of this assessment. However, based on the approximate dates of construction, ACMs may be present at the subject site. During Krazan's January 10, 2019 site reconnaissance, no damaged building materials or friable suspect ACMs which appeared to be posing a health hazard were noted in the on-site structure in accessible areas. Prior to the disturbance of any of the suspect ACMs at this facility via demolition, a comprehensive asbestos survey designed to determine if the suspect ACM is a regulated material is recommended. If such materials are identified and need to be disturbed, repaired, or removed, a licensed abatement contractor should be consulted.

Lead-Based Paint

Although lead-based paint (LBP) was banned in 1978, many building constructed prior to 1978 have paint that contains lead. Lead from paint, chips, and dust can pose serious health hazards if not addressed properly.

The residential structures located on the subject site were constructed in at least 1937, 1979 and 1987. It is unknown if the on-site structures contains LBP. An LBP survey and sampling of the on-site structures was not included within the scope of this assessment. However, based on the approximate dates of construction, LBP may be present at the subject site. During Krazan's January 10, 2019, site reconnaissance, no evidence of chipped or peeling paint was observed in association with the on-site structures in accessible areas. Prior to the disturbance of any of the suspect LBP at this facility via demolition, a comprehensive LBP survey designed to determine if the suspect LBP is a regulated material is recommended. If such materials are identified and need to be disturbed, repaired, or removed, a licensed abatement contractor should be consulted.

Mold and Moisture Intrusion

A class of fungi, molds have been found to cause a variety of health problems in humans, including allergic, toxicological, and infectious responses. Molds are decomposers of organic materials, and thrive in humid environments, and produce spores to reproduce, just as plants produce seeds. When mold spores land on a damp spot indoors, they may begin growing and digesting whatever they are growing on in order to survive. When excessive moisture or water accumulates indoors, mold growth will often occur, particularly if the moisture problem remains undiscovered or unaddressed. As such, interior areas of buildings characterized by poor ventilation and high humidity are the most common locations of mold growth. Building materials including drywall, wallpaper, baseboards, wood framing, insulation and carpeting often play host to such growth. Moisture control is the key to mold control. Molds need both food and water to survive; since molds can digest most things, water is the factor that limits mold growth. The EPA recommends the following action to prevent the amplification of mold growth in buildings:

- Fix leaky plumbing and leaks in the building envelope as soon as possible.
- Watch for condensation and wet spots. Fix source(s) of moisture problem(s) as soon as possible.
- Prevent moisture due to condensation by increasing surface temperature or reducing the moisture level in air (humidity). To increase surface temperature, insulate or increase air circulation. To reduce the moisture level in air, repair leaks, increase ventilation (if outside air is cold and dry), or dehumidify (if outdoor air is warm and humid).
- Keep heating, ventilation, and air conditioning (HVAC) drip pans clean, flowing properly, and unobstructed.
- Vent moisture-generating appliances, such as dryers, to the outside where possible.
- Maintain low indoor humidity, below 60% relative humidity (RH), ideally 30-50%, if possible.
- Perform regular building/HVAC inspections and maintenance as scheduled.
- Clean and dry wet or damp spots within 48 hours.
- Do not let foundations stay wet. Provide drainage and slope the ground away from the foundation.

During Krazan's January 10, 2019, site reconnaissance, spotty mold growth was observed on the exterior back wall of the rural residential structure observed to be located in the southern portion of the subject site. Although the paint beneath the area of mold growth generally appeared to be in good condition, it is unknown if the mold has penetrated the painted surface. The mold growth appears to be related to poor rain water runoff channeling from the roof of the structure. Mold growth was not apparent in any of the remaining structures observed. Given the situation observed on the rural residential structure and the potential for mold growth behind the impacted wallboard, if a higher level of awareness is desired, a mold survey should be conducted by a licensed contractor.

Radon

Radon is a radioactive gas that is found in certain geologic environments and is formed by the natural breakdown of radium, which is found in the earth's crust. A radon survey was not included within the scope of this investigation; however, the State of California Department of Health Services (CDHS) maintains a statewide database of radon results in designated geographic areas. Radon detection devices are placed in homes throughout the study region to determine geographic regions with elevated radon concentrations. The U.S. EPA has set the safety standard for radon gas in homes to be 4.0 pico Curies per liter (pCi/L). The US EPA has prepared a map to assist National, State and local organizations to target their resources and to implement radon-resistant building codes. The map divides the country into three Radon Zones, Zone 1 being those areas with the average predicted indoor radon concentration in residential dwellings exceeding the EPA Action Limit of 4.0 pCi/L. It is important to note that the EPA has found homes with elevated levels of radon in all three zones, and the EPA recommends site-specific testing in order to determine radon levels at a specific location. However, the map does give a valuable indication of the propensity of radon gas accumulation in structures. Review of the EPA Map of Radon Zones places the Property in Zone 2, where average predicted radon levels are between 2.0 and 4.0 pCi/L. Therefore, the available data suggests that the potential for radon to adversely impact the subject site appears to be low.

Wetlands

As defined by the U.S. EPA and the Department of Army, Corps of Engineers, wetlands are “those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions.” Jurisdictional wetlands are regulated under Section 404 of the Clean Water Act (1972, 1977, and 1987, and also the 1985 and 1990 Farm Bills), and are important for protection of aquatic waterfowl and species, water purification, and flood control. According to current Corps of Engineers information, three basic criteria are currently used to define wetlands:

- Wetland hydrology - areas exhibiting surface or near-surface saturation or inundation at some point in time (greater than 12.5 percent of growing season defined on basis of frost-free days) during an average rainfall year.

- Hydrophilic vegetation - frequency of occurrence of wetland indicator plants (plant life growing in water, soil, or substrate that is periodically deficient in oxygen as a result of excessive water content).

- Hydric soil - landscape patterns identified by saturation, flooding, or ponding long enough during the growing season (generally seven days) which develop characteristic color changes in the upper part of the soil as a result of anaerobic conditions.

Based on Krazan’s reconnaissance of the subject site, evidence was not apparent to suggest that the site contained a wetland. Furthermore, according to the U. S. Fish & Wildlife Service (USFWS) National Wetlands Inventory available via the USFWS Internet website, the subject site does not contain a designated wetland. Therefore, at this time, regulations pertaining to wetlands do not appear to impact the subject site.

Environmental Non-Compliance Issues

No obvious material non-compliance issues were identified in connection with the subject site in the process of preparing this report.

Activity and Use Limitations

No activity and use limitations were identified in connection with the subject site in the process of preparing this report.

5.0 USER-PROVIDED INFORMATION

A review of user-provided information was conducted in order to help identify pertinent information regarding potential environmental impacts associated with the subject site. A Final Title Report or Environmental Lien Search were not provided to or prepared by Krazan in conjunction with this assessment.

5.1 Phase I Environmental Site Assessment User Questionnaire

In order to qualify for one of the *Landowner Liability Protections (LLPs)* offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *Brownfields Amendments*), the *user* must provide the following information (if available) to the *environmental professional*. Failure to provide this information could result in a determination that *all appropriate inquiry* is not complete. The user is asked to provide information or knowledge of the following:

1. Environmental cleanup liens that are filed or recorded against the site.
2. Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry.
3. Specialized knowledge or experience of the person seeking to qualify for the LLPs.
4. Relationship of the purchase price to the fair market value of the *property* if it were not contaminated.
5. Commonly known or *reasonably ascertainable* information about the *property*.

6. The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation.

7. The reason for preparation of this Phase I ESA.

A completed questionnaire was not received from the user. The absence of a completed user questionnaire represents a data gap.

6.0 SITE USAGE SURVEY

The property usage survey included assessing property history, and reviewing local, state, and federal regulatory agency records.

6.1 Site History

A review of a previous environmental assessment, historical aerial photographs, a USGS topographic quadrangle map, City of Clovis Planning and Development Department (CCPDD) and Fresno County Public Works and Development Department (FCPWDD) records, reasonably ascertainable city directories, a search for historical fire insurance maps (HFIMs), and a Phase I ESA interview were utilized to assess the history of the subject site.

Aerial Photograph Interpretation

Historical aerial photographs dated 1937, 1946, 1950, 1957, 1962, 1967, 1973, 1979, 1984, 1987, 1998, 2005, 2009, 2012, and 2016 were reviewed to assess the history of the subject site. These photographs were obtained from Environmental Data Resources, Inc. (EDR). The aerial photograph summary is provided in the following Table V below. Please refer to Appendix A in the Table of Contents for a copy of the Historical Aerial Photographs.

TABLE V
Summary of Aerial Photograph Review

Year/Scale	Site Use	Site and Adjacent Property Observation
1937 1" = 500'	Agricultural/ Residential	A rural residential dwelling and associated out-structures are visible in the central-southern portion of the subject site. The subject site and adjacent properties appear to be utilized for agricultural purposes (row crops). The subject site is bounded to the west by N. Sunnyside Avenue, and to the south by a canal. Rural residential dwellings and associated out-structures are visible in the vicinity to the southwest, south and east of the subject site. Vicinity properties to the north, northwest and northeast of the subject site appear to be fallow land.

TABLE V (continued)
Summary of Aerial Photograph Review

Year/Scale	Site Use	Site and Adjacent Property Observation
1946 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1937 aerial photograph except that one long rectangular out-structure on the subject site is no longer visible and one additional out-structure, possibly a barn, is visible in the central-southern portion of the subject site. Additionally, the subject site is in cultivation and three garden plots are visible adjacent to the west of the residential dwelling. A rural residential dwelling and associated out-structures are visible on the northern adjacent property. A vicinity property to the south appears to be fallow land.
1950 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1946 aerial photograph except that the three garden plots are no longer visible adjacent to the west of the residential dwelling. E. Shepherd Avenue has been developed adjacent to the south of the subject site.
1957 1" = 500'	Agricultural/ Fallow Land/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1950 aerial photograph except that the eastern portion of the subject site appears to be fallow land. Several out-structures are no longer visible on the northern adjacent property and the property appears to be fallow land. The adjacent property to the east and vicinity properties to the northeast appear to be fallow land. Two large rectangular structures are visible on the southeastern adjacent property to the subject site. Vicinity properties to the southwest, south and southeast appear to be vacant land. A circular anomaly is visible in the southwestern corner of the subject site which does not appear in the 1957 or 1962 aerial photographs.
1962 1" = 500'	Agricultural/ Vacant Land/ Fallow Land/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1957 aerial photograph except that the southeastern portion of the subject site has been cleared and graded for development. Vicinity properties to the north, northeast and east appear to be vacant land. Three additional large rectangular structures are visible on the southeastern adjacent property.
1967 1" = 500'	Agricultural/ Fallow Land/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1962 aerial photograph except that the eastern portion of the subject site is vacant land. Two large rectangular structures are visible on the southeastern adjacent property to the subject site. Two rural residential structures are visible in the vicinity to the southwest of the subject site.
1973 1" = 500'	Agricultural/ Fallow Land/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1967 aerial photograph except that the southwestern portion of the subject site appears to be utilized for agricultural purposes. Four rural residential dwellings and associated out-structures have been developed on the properties adjacent to the south of the subject site. Three additional large rectangular structures are visible on the southeastern adjacent property.

TABLE V (continued)
Summary of Aerial Photograph Review

Year/Scale	Site Use	Site and Adjacent Property Observation
1979 1" = 500'	Agricultural/ Residential	The subject site appears to be utilized for agricultural purposes. A small residential structure has been developed in the southwestern corner of the northeastern portion of the subject site. One out-structure on the subject site has been removed and replaced with a barn approximately twice as large as the previous structure. At least 15 rural residential dwellings have been developed on the eastern adjacent property to the subject site. At least 8 rural residential dwellings have been developed in the vicinity to the south, 7 rural residential dwellings have been developed in the vicinity to the north and 7 rural residential dwellings have been developed in the vicinity to the northeast of the subject site.
1984 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1979 aerial photograph except that 5 rural residential dwellings have been developed, and at least 10 plots have been cleared for residential development, on the adjacent properties to the north and west of the subject site. Additionally, a new paved road has been developed to access the newly developed residences.
1987 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1984 aerial photograph except that a rural residential dwelling has been developed in the northwestern corner of the northeastern portion of the subject site. The adjacent property to the west and vicinity properties to the west and northwest appear to be fallow land. Several additional structures have been developed on the rural residential properties adjacent to the east of the subject site.
1998 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1987 aerial photograph except that 10 rural residential dwellings have been developed on the adjacent properties to the north and west of the subject site. One rural residential dwelling has been developed on a vicinity property to the north of the subject site. The adjacent property to the west and vicinity properties to the west and northwest appear to have been recently cultivated.
2005 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 1998 aerial photograph except that the adjacent property to the west and vicinity properties to the west and northwest appear to be utilized for agricultural purposes. Residential tract housing has been developed in the vicinity to the southwest of the subject site.
2009 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 2006 aerial photograph except that additional residential tract housing has been developed on the southeastern adjacent property and in the vicinity to the southwest of the subject site. A large commercial structure has been developed in the vicinity to the southeast of the subject site.
2012 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 2009 aerial photograph.

2016 1" = 500'	Agricultural/ Residential	Conditions on the subject site and the adjacent properties appear relatively similar to those noted in the 2012 aerial photograph except that Dry Creek Trailhead has been developed on a southwestern vicinity property, on the southwest corner of N. Sunnyside and E. Shepherd Avenues. A PG&E Substation has been developed in the vicinity to the west of the subject site.

USGS Topographic Quadrangle Map

Krazan's review of the USGS, 7.5 minute, Clovis California topographic quadrangle map dated 1964, photorevised 1981, indicates that two residential structures and a water well are depicted on the subject site. Refer to Figure No. 4, Topographic Map, for reference.

City of Clovis Planning and Development Department and Fresno County Public Works and Development Department

On January 9, 2019, the CCPDD and FCPWDD were visited to review building permit records for the subject site APNs of 557-021-19, -20 and -21, and the historical address of 5230 E. Shepherd Avenue. No building permit records are on file with the CCPDD or FCPWDD for the current APNs or historical subject site addresses. Therefore, no permits for items such as underground storage tanks, demolition, or previous structures/features were revealed for the subject site.

City Directories

Krazan contracted with EDR to provide a review of available city directories for the subject site historic address of 5230 East Shepherd Avenue utilizing approximately five-year intervals. A summary of city directory information is presented in the following Table VI. Please refer to Appendix B in the Table of Contents for a copy of the EDR, City Directory Report.

TABLE VI
Polk Guides Directory Summary

Address	Owner/Occupant	Years
Subject Site		
5230 East Shepherd Avenue	CAL PECAN nuts edible	1996 to 2002

Sanborn Fire Insurance Maps

Krazan reviews SFIMs to evaluate prior land use of the subject site and the adjacent properties. SFIMs typically exist for cities with populations of 2,000 or more, the coverage dependent on the location of the subject site within the city limits. Krazan contracted with EDR to provide copies of available SFIMs for the subject site and the adjacent properties as far back as 1867. EDR's search of

SFIMs revealed no coverage for the subject site and the adjacent properties. Please refer to Appendix C in the Table of Contents for a copy of the EDR SFIM *Unmapped Property* Report.

6.2 Interviews

Krazan strives to conduct an interview with the owner of the subject site. The interview is designed to provide pertinent information regarding potential environmental impacts associated with the subject site.

Subject Site Owner

A completed owner questionnaire was not received from nor was an interview conducted with the property owner. The absence of a completed owner interview/questionnaire represents a data gap.

Previous Subject Site Owners/Occupants

An interview with a previous owner/occupant of the subject site was not reasonably ascertainable. Consequently, the absence of information regarding the history and historical uses of the subject site obtained from an interview of the previous owner and/or occupant constitutes a data gap.

6.3 Agricultural Chemicals

Review of historical aerial photographs indicates the subject site was utilized for agricultural purposes from at least 1937 to present. It is not known if environmentally persistent pesticides and/or herbicides were historically applied to the crops grown on the subject site. Although the potential exists that environmentally persistent pesticides/herbicides were historically applied to the crops grown on the subject site, 1) no material evidence of the use of environmentally persistent pesticides/herbicides was obtained during the course of this assessment, 2) Krazan's sampling analysis of surface soils from properties with similar agricultural histories in the subject site area has typically yielded non-detectable results or very low concentrations for analysis of environmentally persistent pesticides/herbicides, and 3) based upon the soil disturbance in conjunction with the grading and trenching activities during the proposed redevelopment of the subject site, it is likely that potential agricultural chemicals would be significantly mixed and diluted. Consequently, given the above-referenced factors and Krazan's experience in the subject site vicinity which generally indicates that the potential is low for elevated concentrations of environmentally persistent pesticides/herbicides related to agricultural cultivation to exist in the near-surface soils of common agricultural ground at concentrations which would require regulatory action, despite the absence of specific data, the potential for elevated concentrations of environmentally persistent pesticides/herbicides to currently exist in the near-surface soils of the subject site at concentrations which would require regulatory action appears to below.

6.4 Regulatory Agency Interface

A review of regulatory agency records was conducted to help determine if hazardous materials have been handled, stored, or generated on the subject site and/or the adjacent properties and businesses. Regulatory records are reviewed based on the following criteria: 1) properties with known soils and/or groundwater releases considered to represent the potential for impact to the subject site that are located within 1,760 feet of the subject site for constituents of concern impacts or 528 feet of the subject site for petroleum hydrocarbon impacts; 2) properties that are adjacent or in proximity to the subject site included within the EDR regulatory database report or noted during the site reconnaissance to possibly handle, store, or generate hazardous materials.

Fresno County Department of Community Health, Environmental Health System

The Fresno County Department of Community Health, Environmental Health System (FCEHS) is the lead regulatory agency or Certified Unified Program Agency (CUPA) for hazardous materials handling facilities in Fresno County. Krazan's review of the FCEHS CUPA and Solid Waste Programs Resource List (CUPA List) dated January 7, 2019, indicated that no records are on file with the FCEHS for the subject site. However, records are on file with the FCEHS for adjacent and vicinity properties which do not represent material evidence of the potential to represent environmental concern to the subject site. The factors and considerations utilized in deriving the above-referenced conclusion for each of the sites are summarized in the following Table VII.

TABLE VII
Proximate Property CUPA Listings

Site Name/Address	Orientation to Subject Site/ Groundwater Flow Direction	Regulatory Status/ Potential to Impact Subject Site
Wilson Development Property 4767 E. Shepherd Avenue	Adjacent to the south of subject site/ Southwest – Down/Cross-gradient of subject site	UST Removal/ Closure w/1 Tank/ Low
P-R Farms 4650 E. Shepherd Avenue	158 feet to the southwest of subject site / Southwest – Downgradient of subject site	Hazardous Materials Handler Farm Exemption/ Low
PG&E Shepherd Substation N. Sunnyside Avenue	1,089 feet to the north/ northwest of subject site / Southwest – Cross-gradient of subject site	Small Hazardous Materials Handler / Low

City of Clovis Fire Department

The City of Clovis Fire Department (CCFD) has jurisdiction for the fire protection for the subject site and the immediate vicinity. According to representatives of the CCFD, records of hazardous materials incidents are kept by the FCEHS. Additionally, hazardous/flammable incidents are filed according to the date of occurrence and by the location of occurrence with the FCEHS.

State of California Regional Water Quality Control Board – Geotracker

Krazan's January 9, 2019, review of the State of California Regional Water Quality Control Board (RWQCB) Geotracker database available via the RWQCB Internet Website indicated that no sites including LUST sites, cleanup program sites, land disposal sites, or military sites are listed for the subject site, the adjacent properties, or properties located within the subject site vicinity. Additionally, no permitted UST sites were determined to be located on or adjacent to the subject site.

State of California Department of Toxic Substances Control – Envirostor

Krazan's January 9, 2019, review of the State of California Department of Toxic Substances Control (DTSC) Envirostor database available via the DTSC's Internet Website indicated that no sites including State response sites, voluntary cleanup sites, school cleanup sites, or military or school evaluation sites are listed for the subject site, the adjacent properties, or properties located within 1,000 feet of the subject site. Additionally, no Federal Superfund – National Priorities List (NPL) sites were determined to be located within a one-mile radius of the subject site.

California Department of Conservation, Division of Oil, Gas & Geothermal Resources - DOMS

Krazan's January 9, 2019, review of the State of California Department of Conservation, Division of Oil, Gas and Geothermal Resources (DOGGR) Online Mapping System (DOMS) indicated that no plugged and abandoned or producing oil wells are located on or adjacent to the subject site.

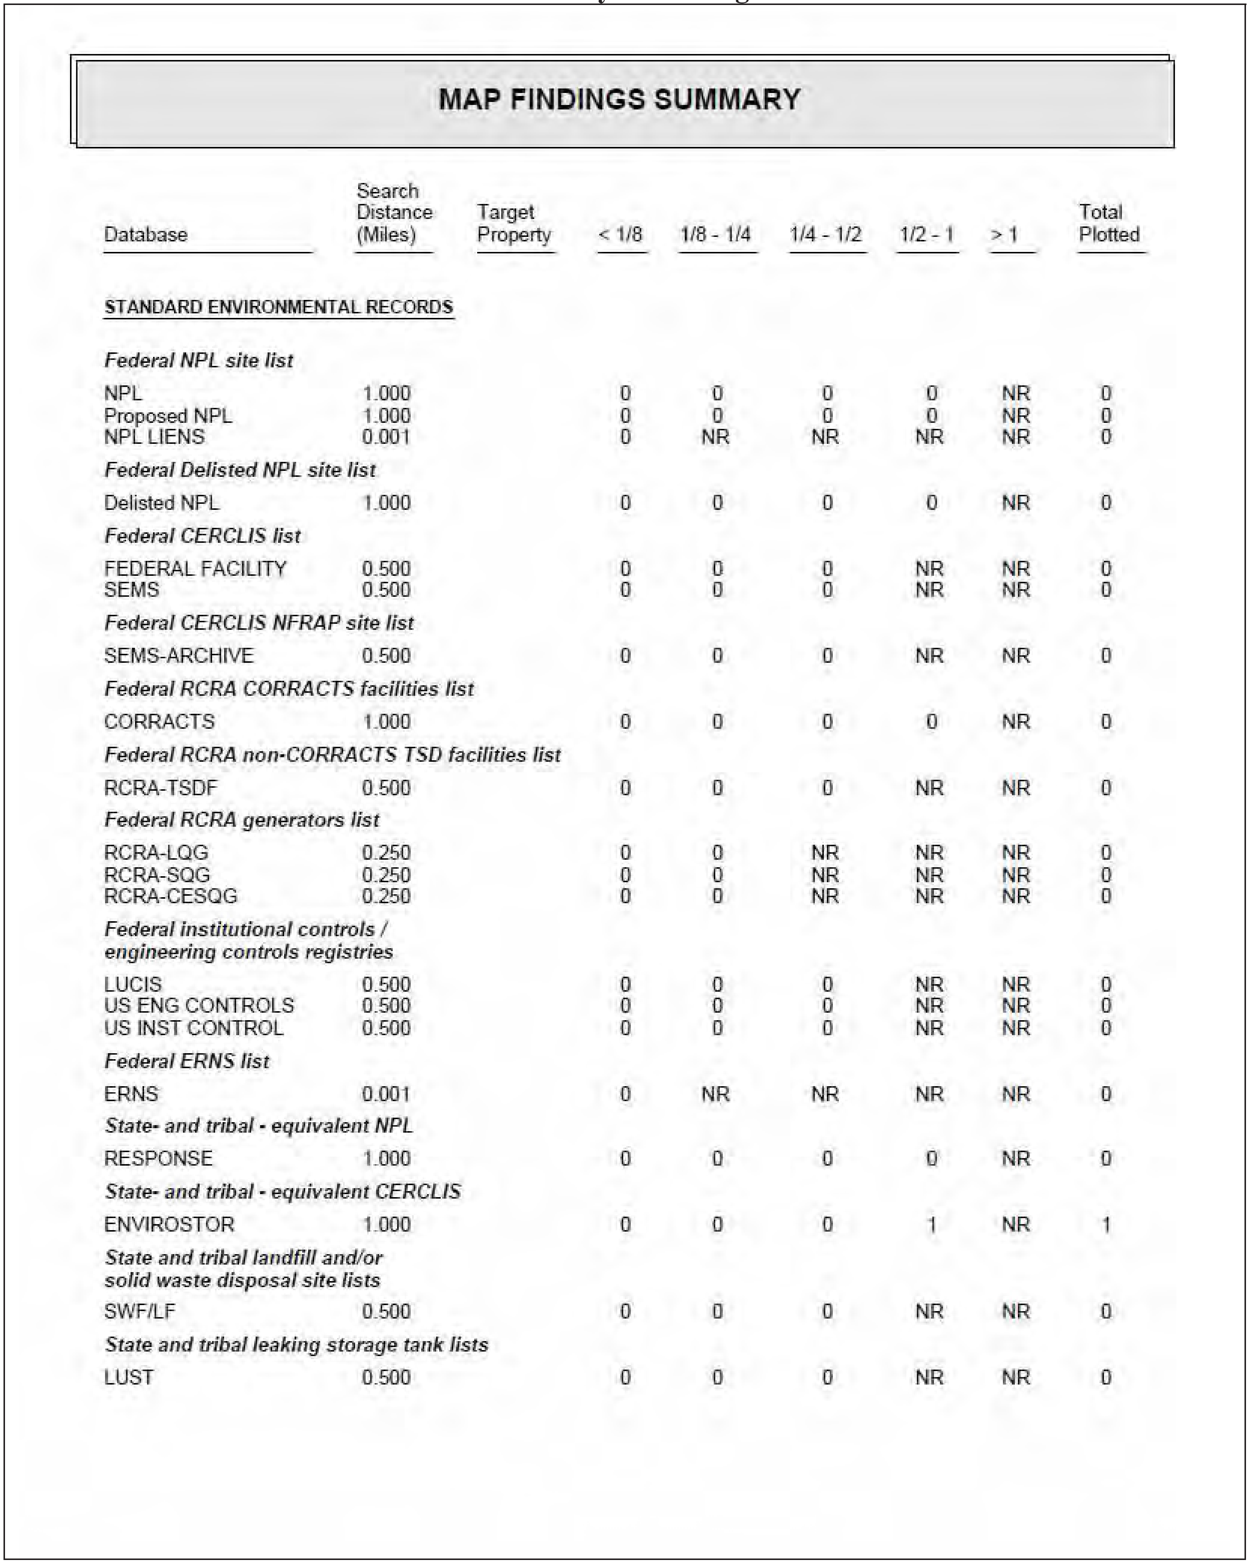
Local Area Tribal Records

No Indian reservations, USTs on Indian land, or LUSTs on Indian land were reported on the subject site, adjacent properties, or vicinity properties in the EDR-provided government database report.

6.5 Regulatory Agency Lists Review

Several agencies have published documents that list businesses or properties which have handled hazardous materials or waste or may have experienced site contamination. The lists consulted in the course of our assessment were compiled by EDR and Krazan and represent reasonably ascertainable current listings. Krazan did not verify the locations and distances of every property listed by EDR. Krazan verified the location and distances of the properties Krazan deemed as having the potential to adversely impact the subject site. The actual location of the listed properties may differ from the EDR listing. Refer to the following Table VIII for a summary of the listed properties considered to have the potential to impact the subject site located within the specified ASTM Search Radii. The actual distances of the listed properties (which are summarized below) are based on observations during Krazan's site reconnaissance. No EDR-listed unmapped (non geocoded) sites were determined to be located on or adjacent to the subject site. Please refer to Appendix D in the Table of Contents for a copy of the EDR Radius Map Report.

TABLE VIII
Summary of Findings



MAP FINDINGS SUMMARY

Database	Search Distance (Miles)	Target Property	< 1/8	1/8 - 1/4	1/4 - 1/2	1/2 - 1	> 1	Total Plotted

NOTES:

TP = Target Property

NR = Not Requested at this Search Distance

Sites may be listed in more than one database

There were no listings for the subject site or adjacent properties.

The following property was listed in the vicinity of the subject site:

> P-R Farms, Inc. approximately 158-173 feet to the southwest
> 4648-4650 East Shepherd Avenue
> According to EDR, this facility is listed a CUPA Listings, SWEEPS UST, CA FID UST, and HIST UST site including a 500-gallon gasoline tank and a 2,000-gallon diesel tank on a farm property installed in at least 1985. No records for releases or removal were found on file with the FCEHS, RWQCB or DTSC. Based on Krazan's review of available regulatory records and its hydraulically cross-gradient location from the subject site, there is no evidence to suggest that this facility represents an environmental concern in connection with the subject site.

The remaining properties within the specified search radius of the subject site which appeared on local, state, or federally published lists of sites that use or have had releases of hazardous materials or petroleum products are of sufficient distance and/or situated hydraulically cross- or downgradient from the subject site such that impact to the subject site via groundwater migration is unlikely. In general, potentially hazardous materials released from facilities located approximately hydraulically upgradient within the subject site vicinity, or in a hydraulically cross-gradient direction in proximity to the site, may have a reasonable potential of migrating to the subject site via groundwater flow. This opinion is based on the assumption that non-vaporous hazardous materials generally do not migrate large distances laterally within the soil, but rather tend to migrate with groundwater in the general direction of groundwater flow. However, the potential for migration of volatile hazardous materials may include movement within soils, groundwater flow or potentially omni-directionally if present in a vaporous state.

Hazardous Materials Migration in Vapor

Hazardous materials or petroleum product vapors which may have the potential to migrate into the subsurface of the subject site may be caused by the release of vapors from contaminated soil or groundwater either on or in the vicinity of the subject site from current or historical uses of the subject site and/or adjacent or vicinity properties. Current or past land uses such as gasoline stations (using petroleum hydrocarbons), dry cleaning establishments (using chlorinated volatile organic compounds), former manufactured gas plant sites (using volatile and semi-volatile organic compounds), and former industrial sites such as those that had vapor degreasing or other parts-cleaning operations (using chlorinated volatile organic compounds) are of particular concern. Constituent of concern vapors are capable of migrating great distances omni-directionally along subsurface conduits such as pipelines, utility lines, sewer and stormwater lines, and building foundations.

Based on Krazan's observations and review of the EDR regulatory database report, no listings of concern were determined to be associated with the subject site, adjacent properties, or properties located within the subject site vicinity. However, the screening process for vapor migration in connection with the subject site is described in the ASTM E 2600-10 *Standard Guide for Vapor Encroachment Screening on Property Involved in Real Estate Transactions,* an industry consensus methodology to assess vapor migration which is not included in the scope of work of this Phase I ESA.

No engineering control sites, sites with institutional controls, or sites with deed restrictions were listed for the subject site, adjacent sites or vicinity properties in the EDR Report.

7.0 DISCUSSION OF FINDINGS

TABLE IX
Summary of Conclusions

Apparent Evidence of RECs/PAOCs From:	Not Noted	Noted
Historical Uses		X
Current Uses		X
Adjacent or Vicinity Property Uses	X	

Historical Uses

Based on Krazan's review of historical aerial photographs, a site reconnaissance, and contacts with the local regulatory agencies, there is evidence that PAOCs exist in connection with the historical uses of the subject site.

Current Uses

Based on Krazan's site reconnaissance and contacts with local regulatory agencies, there is evidence that PAOCs exist in connection with the current uses of the subject site.

Adjacent or Vicinity Property Uses

Based on Krazan's review of historical research of the subject site, a site reconnaissance, contacts with the State and local regulatory agencies, and review of the EDR regulatory database report, there is no evidence that RECs or PAOCs exist in connection with the subject site from adjacent or vicinity properties.

7.1 Evaluation of Data Gaps/Data Failure

In accordance with ASTM E 1527-13 guidance, data gaps represent a lack of or inability to obtain information required by this practice despite good faith efforts by the environmental professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice. Data failure represents the failure to achieve the historical research objectives of this practice even after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful. Data failure is one type of data gap. The following is a summary of data gaps encountered in the process of preparing this report including an observation as to the presumed significance of that data gap to the conclusions of this assessment.

- <u>Inaccessibility (Section 4.1)</u>

  A small residential structure was observed to be located in the central-eastern portion of the subject site. Access was not granted to the structure at the time of the site reconnaissance because a trailer was parked up against the building, blocking the only entrance to the structure. Additionally, the three windows observed were all too frosted to allow observation of the interior. The absence of interior site inspection represents a data gap. However, given the apparent residential nature of the structure taken in consideration with the available information obtained in the course of preparing this report in conjunction with professional experience, there is no material evidence that this data gap might alter the conclusions of this assessment. However, the contents and condition of the interior of the unobservable structure are unknown.

- <u>Absence of Final Title Report or Environmental Lien Search (Section 5.1)</u>

  A Final Title Report or Environmental Lien Search were not provided by the Phase I ESA user, therefore a data gap exists. Taken in consideration with the available information obtained in the course of preparing this report in conjunction with professional experience, there is no evidence to suggest that this data gap might alter the conclusions of this assessment. However, the contents of a Final Title Report or Environmental Lien Search are unknown.

- <u>Absence of User Questionnaire (Section 5.2)</u>

  A completed User Questionnaire was not provided by the Phase I ESA user; therefore, a data gap exists. Taken in consideration with the available information obtained in the course of preparing this report in conjunction with professional experience, there is no material evidence that this data gap might alter the conclusions of this assessment. However, the contents of a completed User Questionnaire are unknown.

- Unknown Date of First Development (Section 6.1)
  Site history prior to 1937 was not reasonably ascertainable based upon review of standard historical sources. Consequently, data failure was encountered relative to date of first development of the subject site. Taken in consideration with the available information obtained in the course of preparing this report in conjunction with professional experience, there is no evidence to suggest that this data gap might alter the conclusions of this assessment. However, the date of first development of the subject site is unknown.

- Absence of Interview with Current or Previous Property Owners/Occupants (Section 6.2)
  A Phase I ESA interview with the current or previous owners/occupants of the subject site was not reasonably ascertainable. Consequently, information regarding the history and historical uses of the subject site obtained from an interview of a current or previous owner and/or occupant constitutes a data gap. Taken in consideration with the available information obtained in the course of preparing this report in conjunction with professional experience, there is no material evidence that this data gap might alter the conclusions of this assessment. However, the contents of an interview with a current/previous property owner are unknown.

8.0 CONCLUSIONS/OPINIONS

We have conducted a Phase I ESA of the subject site in conformance with the scope and limitations of the ASTM E 1527-13 *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* guidance documents. Any deviations from this practice were previously described in this report. During the course of this assessment, Krazan identified no evidence of recognized environmental conditions (RECs), controlled RECs (CRECs) and historical RECs (HRECs) in conjunction with the subject site as defined by ASTM E 1527-13. However, the following potential areas of concern (PAOCs), non-scope issues and site development issues are presented:

PAOCs

- Adjacent to the north of the on-site warehouse and lined against its back wall, three approximately 250-gallon aboveground storage (AST) tanks were observed. Two ASTs contained diesel fuel and the third contained gasoline. Additionally, four 55-gallon drums containing motor oil were observed to be located to the west of the ASTs which exhibited *de* *minimis* staining. The site reconnaissance was completed a day following a heavy rain event and it was not clear if the ground surface below the ASTs and/or drums exhibited any significant petroleum product staining because the ground remained saturated with rainwater precluding visual observations. Consequently, the specific condition of the ground surface underlying the ASTs and drums is unknown.

- Krazan's review of aerial photographs indicates that the subject site was utilized for agricultural purposes from at least 1937 to the present and that residential structures and associated outbuildings occupied the property from at least 1937, 1979 and 1987 to the present. No records of USTs for the subject site are on file with the local regulatory agencies; however, USTs on rural or agricultural properties historically have been exempt from requirements for registration with regulatory agencies. Furthermore, Krazan's experience with such properties has shown that it was not uncommon for property owners/operators to install USTs for their convenience, especially in the vicinity of structures, which are undocumented and whose presence would remain unknown in spite of the standard data research conducted in the course of this Phase I ESA. It is therefore possible that subsurface features such as unregistered fuel USTs may exist within the structure-related portions of the subject site which remain unknown based on the absence of any regulatory, municipality, and/or interview data, or other evidence indicating their presence or location. Consequently, despite an absence of data suggesting their presence, the presence or absence of USTs associated with on-site structures in a historical agricultural setting on the subject site is unknown.

NON-SCOPE ISSUES

- The residential dwellings/structures located on the subject site appears to have been originally constructed in at least 1937, 1979 and 1987. It is unknown if the on-site dwellings/structures contain asbestos-containing materials (ACMs) or lead-based paint (LBP). An asbestos and/or LBP survey and sampling of the on-site dwellings/structures was not included within the scope of this assessment. However, based upon the approximate apparent dates of construction, ACMs and LBP may be present at the subject site. During Krazan's site reconnaissance, no damaged building materials which appeared to be posing a health hazard were noted within those areas of the on-site residential dwellings/structures observed. Prior to the disturbance of any of the suspect ACMs or LBP at the subject site via renovation or demolition, a comprehensive asbestos and LBP survey designed to determine if the suspect ACM and LBP are regulated materials is recommended. If such materials are identified and need to be disturbed, repaired, or removed, a licensed abatement contractor should be consulted.

SITE DEVELOPMENT ISSUES

- Based on Krazan's historical research and interviews, two domestic water wells and five agricultural water wells were observed to be associated with the subject site. If the on-site water wells are not to be used in the future, they should be properly abandoned/destroyed in accordance with state and local guidelines.

9.0 RELIANCE

This report was prepared solely for use by Client and should not be provided to any other person or entity without Krazan & Associates' prior written consent. No party other than Client may rely on this report without Krazan & Associates' express prior written consent. Reliance rights for third parties will only be in effect once requested by Client and authorized by Krazan & Associates with authorization granted by way of a Reliance Letter. The Reliance Letter will require that the relying party(ies) agree to be bound to the terms and conditions of the agreement between Client and Krazan & Associates as if originally issued to the relying party(ies), or as so stipulated in the Reliance Letter.

10.0 LIMITATIONS

The site reconnaissance and research of the subject site has been limited in scope. This type of assessment is undertaken with the calculated risk that the presence, full nature, and extent of contamination would not be revealed by visual observation alone. Although a thorough site reconnaissance was conducted in accordance with ASTM Guidelines and employing a professional standard of care, no warranty is given, either expressed or implied, that hazardous material contamination or buried structures, which would not have been disclosed through this investigation, do not exist at the subject site. Therefore, the data obtained are clear and accurate only to the degree implied by the sources and methods used.

The findings presented in this report were based upon field observations during a single property visit, review of available data, and discussions with local regulatory and advisory agencies. Observations describe only the conditions present at the time of this investigation. The data reviewed and observations made are limited to accessible areas and currently available records searched. Krazan cannot guarantee the completeness or accuracy of the regulatory agency records reviewed. Additionally, in evaluating the property, Krazan has relied in good faith upon representations and information provided by individuals noted in the report with respect to present operations and existing property conditions, and the historical uses of the property. It must also be understood that changing circumstances in the property usage, proposed property usage, subject site zoning, and changes in the environmental status of the other nearby properties can alter the validity of conclusions and information contained in this report. Therefore, the data obtained are clear and accurate only to the degree implied by the sources and methods used.

This report is provided for the exclusive use of the client noted on the cover page and shall be subject to the terms and conditions in the applicable contract between the client and Krazan. Any third party use of this report, including use by Client's lender, shall also be subject to the terms and conditions governing the work in the contract between the client and Krazan. The unauthorized use of, reliance on, or release of the information contained in this report without the express written consent of Krazan is strictly prohibited and will be without risk or liability to Krazan. Conclusions and recommendations contained in this report are based on the evaluation of information made available during the course of this assessment. It is not warranted that such data cannot be superseded by future environmental, legal, geotechnical or technical developments. Consequently, given the possibility for unanticipated hazardous conditions to exist on a subject site which may not have been discovered, this Phase I ESA is not intended as the basis for a buyer or developer of real property to waive their rights of recovery based upon environmental unknowns. Parties that choose to waive rights of recovery prior to site development do so at their own risk.

Parties who seek to rely upon Phase I Environmental Site Assessment reports dated more than 180 days prior to the date of reliance do so at their own risk. This limitation in reliance is based on the potential for physical changes at the site, changes in circumstances, technological and professional advances, and guidance related to the continued viability of Environmental Site Assessment reports, user's responsibilities, and requirements for updating of components of the inquiry as stated in the ASTM Standard E 1527-13.

11.0 QUALIFICATIONS

This Phase I ESA was conducted under the supervision or responsible charge of Krazan's undersigned environmental assessor with oversight from the undersigned environmental professional. The work was conducted in accordance with ASTM E 1527-13 guidance, generally accepted industry standards for environmental due diligence in place at the time of the preparation of this report, and Krazan's quality-control policies.

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in §312.10 of 40 CFR 312 and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property.

We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

Respectfully submitted,
KRAZAN & ASSOCIATES, INC.

Michelle L. Phillips
Environmental Specialist

Arthur C. Farkas, REA
Environmental Professional

GLOSSARY OF TERMS

Subject Site: The real property being investigated under this Phase I ESA.

Adjacent Properties: Properties which are contiguous with the subject site, or would be contiguous except for a street, road, or other public thoroughfare.

Subject Site Vicinity: Properties located within a 500-foot radius of the subject site.

Environmental Professional: A person meeting the education, training, and experience requirements as set forth in 40 CFR §312.10(b). The EP may be an independent contractor or an employee of the user.

User: The party seeking to use Practice E 1527 to complete an environmental site assessment of the subject site. A user may include, without limitation, a potential purchaser of the subject site, a potential tenant of the subject site, an owner of the subject site, a lender, or a property manager.

Recognized Environmental Condition (REC): In defining a standard of good commercial and customary practice for conducting an environmental site assessment of a parcel of property, the goal of the processes established by this practice is to identify recognized environmental conditions. The term recognized environmental conditions means the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to any release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. *De minimis* conditions are not recognized environmental conditions.

Controlled Recognized Environmental Condition (CREC): A recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). For example, if a leaking underground storage tank has been cleaned up to a commercial use standard, but does not meet unrestricted residential cleanup criteria, this would be considered a CREC. The “control” is represented by the restriction that the property use remain commercial. A condition considered by the environmental professional to be a CREC shall be listed in the findings section of the Phase I ESA report and as an REC in the conclusions section. A condition identified as a CREC does not imply that the environmental professional has evaluated or confirmed the adequacy, implementation, or continued effectiveness of the required control that has been, or is intended to be, implemented.

Historical Recognized Environmental Condition (HREC): A past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls). Before calling the past release an HREC, the environmental professional must determine whether the past release is an REC at the time the Phase I ESA is conducted (for example, if there has been change in the regulatory criteria). If the EP considers the past release to be an REC at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as an REC.

GLOSSARY OF TERMS (continued)

Potential Area of Concern (PAOC): A term adopted to provide an alternative designation to the REC and HREC for a range of environmental issues related to current subject site uses, historical subject site uses, or from adjacent and/or vicinity property uses. The PAOC is utilized to emphasize full disclosure and provide the User with conclusions and recommendations related to potential environmental issues in connection with the subject site based on Krazan's professional experience in cases where official documentation or other evidence may be absent in order to identify an REC or HREC, thereby aiding the User's considerations of environmental due diligence risk tolerance.

Migrate/migration: For the purposes of this practice, "migrate" and "migration" refer to the movement of hazardous substances or petroleum products in any form, including, for example, solid and liquid at the surface or subsurface, and vapor in the subsurface. Vapor migration in the subsurface is described in ASTM E 2600-10 guidance; however, nothing in the E 1527-13 practice should be construed to require application of the E 2600-10 standard to achieve compliance with AAI.

De minimis condition: A condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Condition determined to be *de minimis conditions* are not RECS or CRECs.

Data Gap: A lack of or inability to obtain information required by this practice despite good faith efforts by the Environmental Professional to gather such information. Data gaps may result from incompleteness in any of the activities required by this practice, including, but not limited to the site reconnaissance and interviews.

Data Failure: A failure to achieve the historical research objectives even after reviewing the standard historical sources that are reasonably ascertainable and likely to be useful. Data failure is one type of data gap.

GLOSSARY OF TERMS (continued)

AAI	All Appropriate Inquiries
AC	Asphalt Concrete
ACM	Asbestos-Containing Materials
AOC	Area of Concern
APN	Assessor's Parcel Number
AST	Aboveground Storage Tank
ASTM	American Society for Testing and Materials
AS	Air Sparging
AUL	Activity & Use Limitations
bgs	Below Ground Surface
BTEX	Benzene, Toluene, Ethylbenzene, Xylenes
CERCLA	Comprehensive Environmental Response Compensation and Liability Act
CESQG	Conditionally Exempt Small Quantity Generator
CFR	Code of Federal Regulations
CMU	Concrete Masonry Unit
COCs	Constituents of Concern
DEULs	Declaration of Environmental Use Restrictions
DOGGR	Division of Oil, Gas & Geothermal Resources (CA)
DTSC	Department of Toxic Substances Control (CA)
EC	Engineering Control
EDR	Environmental Data Resources, Inc.
EP	Environmental Professional
EPA	United States Environmental Protection Agency
ERP	Emergency Response Plan
ESA	Environmental Site Assessment
ESL	Environmental Screening Level
FOIA	Freedom of Information Act
GPR	Ground Penetrating Radar
HCCD	Haines Criss-Cross Directory
HFIM	Historical Fire Insurance Map
HMBP	Hazardous Materials Business Plan
HREC	Historical Recognized Environmental Condition
HVAC	Heating, Ventilation, Air Conditioning
IC	Institutional Control
LBP	Lead-Based Paint
LLP	Landowner Liability Protection
LQG	Large Quantity Generator
LUC	Land Use Control
LUST	Leaking Underground Storage Tank
MCL	Maximum Contaminant Level
µg/L	Micrograms Per Liter
mg/kg	Milligrams Per Kilogram
mg/L	Milligrams Per Liter
MSDS	Material Safety Data Sheet
MTBE	Methyl Tertiary Butyl Ether
MFR	Multi-Family Residential
ND	Nondetectable
NFA	No Further Action (letter)
NPDES	National Pollution Discharge Elimination System
NPL	National Priorities List
O&M	Operations & Maintenance Plan
PAOC	Potential Area of Concern
PCB	Polychlorinated Biphenyl
PCC	Portland Cement Concrete
PCE	Perchloroethylene
PEC	Potential Environmental Concern (TS)
PGD	Polk Guide Directory
PG&E	Pacific Gas & Electric
PHCs	Petroleum Hydrocarbon Constituents
PID	Photoionization Detector
ppb	Parts Per Billion
ppm	Parts Per Million
PRG	Preliminary Remediation Goal
PRP	Potentially Responsible Party
RAP	Remedial Action Plan
RCRA	Resource Conservation and Recovery Act
REC	Recognized Environmental Condition
RP	Responsible Party
RWQCB	Regional Water Quality Control Board (CA)
SBA	Small Business Administration
SFR	Single-Family Residential
SPCC	Spill Prevention Control and Countermeasure Plan
SQG	Small Quantity Generator
SCE	Southern California Edison
SVE	Soil Vapor Extraction
SVOC	Semi-Volatile Organic Compound
SWRCB	State Water Resources Control Board
TCE	Trichloroethylene
TPH	Total Petroleum Hydrocarbons
TPH-D	Total Petroleum Hydrocarbons as Diesel
TPH-G	Total Petroleum Hydrocarbons as Gasoline
TPH-MO	Total Petroleum Hydrocarbons as Motor Oil
TS	Transaction Screen
USGS	United States Geological Survey
USFWS	United States Fish & Wildlife Service
UST	Underground Storage Tank
VEC	Vapor Encroachment Condition
VES	Vapor Encroachment Screening
VOCs	Volatile Organic Compounds

Photo 3: Southern-facing view of the western boundary along N. Sunnyside Avenue from the westernmost northwestern corner of the subject site.

Photo 4: Eastern-facing view of the northern boundary of the western portion, from the westernmost northwestern corner of the subject site.

Photo 5: Northern-facing view of the western boundary of the eastern portion of the subject site.

Photo 6: Eastern-facing view of the northern boundary of the eastern portion of the subject site from the northernmost northwestern corner. Visible are a domestic water well and associated tank.

Photo 7: Western-facing view of the northern boundary from the northeastern corner of the subject site.

Photo 8: Southern-facing view of the eastern boundary from the northeastern corner of the subject site.

Photo 9: Northern-facing view of the eastern boundary from the southeastern corner of the subject site. Visible are two pole-mounted transformers.

Photo 10: Western-facing view of the southern boundary along E. Shepherd Avenue, from the southeastern corner of the subject site.

Photo 11: Northeastern-facing view of the rural residential structure located along the southern boundary of the subject site. Visible is a water well and utility vault.

Photo 12: Close up view of the water well observed to be located adjacent to the west of the rural residential structure located along the southern boundary of the subject site.

Photo 13: Southern-facing view of the rural residential structure located along the southern boundary of the subject site.

Photo 14: Interior view of the kitchen observed to be located in the rural residential structure located along the southern boundary of the subject site.

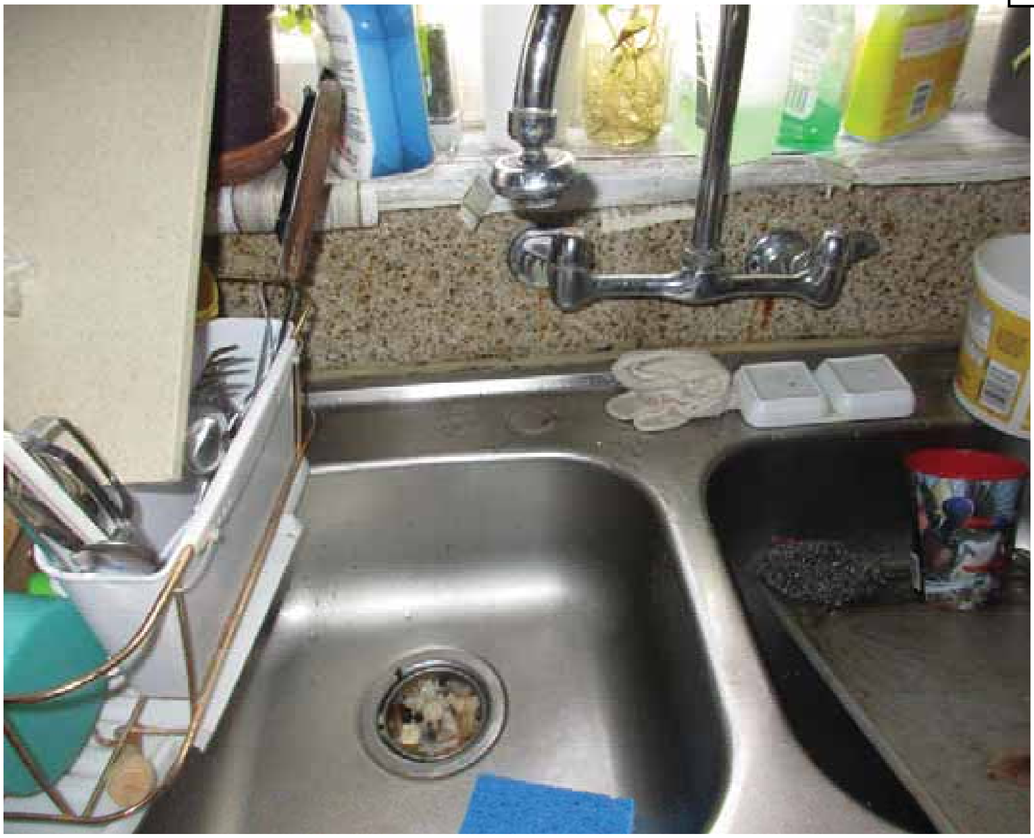

Photo 15: Close up view of the kitchen sink located in the rural residential structure located along the southern boundary of the subject site.

Photo 16: Interior view of the bathroom located in the rural residential structure located along the southern boundary of the subject site.

Photo 17: Interior view of the living room located in the rural residential structure located along the southern boundary of the subject site.

Photo 18: Interior view of the warehouse located adjacent to the north of the rural residential structure located in the southern portion of the subject site. Visible are pallets, a ladder and several refrigerators.

Photo 19: Interior view of the men's restroom observed to be located in the warehouse in the southern portion of the subject site.

Photo 20: Interior view of the warehouse located in the southern portion of the subject site. Visible are pallets of bagged product, a forklift, a large crack in the concrete foundation, and *de minimis* staining.

Photo 21: Interior view of a small storage room located inside the warehouse located in the southern portion of the subject site. Visible is a generator, Roundup herbicide, and Zinc Sulfate fertilizer.

Photo 22: Southern-facing view of three ASTs located adjacent to the north of the warehouse located in the southern portion of the subject site. Two ASTs contain diesel and the third AST contains gasoline.

Photo 23: Close up view of the two diesel ASTs observed adjacent to the warehouse. *De minimis* staining was observed on the bottoms of the tanks.

Photo 24: Close up view of the gasoline AST observed adjacent to the warehouse. *De minimis* staining was observed on the bottom of the tank.

Photo 25: Close up view of the ground below the ASTs, observed to be located adjacent to the north of the warehouse. Also visible are 55-gallon drums.

Photo 26: Northern-facing view of an electric-powered heater observed to be located in the bay of the warehouse located in the southern portion of the subject site. *De minimis* staining was observed around the motor.

Photo 27: Close up view of a subsurface concrete pit observed to be located in the bay of the warehouse located in the southern portion of the subject site. The pit is utilized for drying pecans.

Photo 28: Close up view of access panels to a subsurface concrete pit, observed to be located in the bay of the warehouse located in the southern portion of the subject site.

Photo 29: Interior view of a shop room observed to be located in the warehouse located in the southern portion of the subject site. Visible are compressed gas cylinders.

Photo 30: Close up southern-facing view of three 55-gallon drums containing motor oil observed to be located adjacent to the north of the warehouse. *De minimis* staining was observed on the drums. Also visible are trash bins.

Photo 31: Northern-facing view of a petroleum tank observed to be located adjacent to the north of the warehouse located in the southern portion of the subject site.

Photo 32: Southern-facing view of the warehouse observed to be located in the southern portion of the subject site. Visible are three ASTS and a petroleum tank.

Photo 33: Northeastern-facing view of a water well and standpipe observed to be located in the southwestern corner of the subject site.

Photo 34: Eastern-facing view of a small residential dwelling and water well observed to be located in the central-eastern portion of the subject site.

Photo 35: Eastern-facing view of a small residential dwelling observed to be located in the central-eastern portion of the subject site. Visible is concrete debris, a trailer, a satellite dish and farming equipment.

Photo 36: Northwestern-facing view of a small residential dwelling observed to be located in the central-eastern portion of the subject site. Visible are stacks of tires, a portable water tank and a trailer.

Photo 37: Close up western-facing view of a water well observed to be located adjacent to the east of the small residential dwelling.

Photo 38: Eastern-facing view of a water well and two pole-mounted transformers observed to be located in the central-eastern portion of the subject site.

Photo 39: Close up view of the water well observed to be located in the central-eastern portion of the subject site.

Photo 40: Close up view of the two pole-mounted transformers observed to be located in the central-eastern portion of the subject site.

Photo 41: Northwestern-facing view of a water well observed to be located in the northwestern portion of the subject site.

Photo 42: Western-facing view of a water well and associated water tank observed to be located in the northwestern portion of the subject site.

Photo 43: Eastern-facing view of a rural residential dwelling observed to be located in the northwestern portion of the subject site.

Photo 44: Interior view of the kitchen observed to be located in the rural residential structure located in the northwestern portion of the subject site.

Photo 45: Interior view of the living room located in the rural residential structure observed to be located in the northwestern portion of the subject site.

Photo 46: Interior view of the bathroom located in the rural residential structure observed to be located in the northwestern portion of the subject site.

Photo 47: Close up Interior view of the bathroom located in the rural residential structure observed to be located in the northwestern portion of the subject site.

Photo 48: Southern-facing view of the backyard of the rural residential structure observed to be located in the northwestern portion of the subject site.

Photo 49: Northern-facing view of the backyard of the rural residential structure observed to be located in the northwestern portion of the subject site.

Photo 50: Southwestern-facing view of the larger of two berms of tree branches and debris observed to be located along the eastern boundary of the subject site.

Photo 51: Southeastern-facing view of the larger of two berms of tree branches and debris observed to be located along the eastern boundary of the subject site.

Photo 52: Western-facing view of two utility vaults observed to be located on the southern boundary, along E. Shepherd Avenue, of the subject site.

Photo 53: Northwestern-facing view of a water well and stand pipe observed to be located in the eastern portion of the subject site.

Photo 54: Southeastern-facing view of the smaller of two berms of tree branches and debris observed to be located along the eastern boundary of the subject site.

Photo 55: Northeastern-facing view of the larger of two berms of tree branches and debris observed to be located along the eastern boundary of the subject site.

Photo 56: Northwestern-facing view of the larger of two berms of tree branches and debris observed to be located along the eastern boundary of the subject site.

Photo 57: Northern-facing view of the smaller of two berms of tree branches and debris observed to be located along the eastern boundary of the subject site. Also visible are three trailers.

Photo 58: Northern-facing view of two pole-mounted transformers observed to be located on the eastern boundary of the subject site.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2014. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

Site Name:	**Client Name:**
Tract No. 6205 Property	Krazan & Associates, Inc.
5230 E Shepherd Ave	215 West Dakota
Clovis, CA 93619	Clovis, CA 93612
EDR Inquiry # 5516721.3	Contact: Michelle Phillips

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Krazan & Associates, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control’s (DTSC’s) Site Mitigation and Brownfields Reuse Program’s (SMBRP’s) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/29/2018 has revealed that there is 1 ENVIROSTOR site within approximately 1 mile of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
NORTH CLOVIS AVENUE Facility Id: 10010017 Status: No Further Action	***CLOVIS AVENUE/TEAGUE***	***SW 1/2 - 1 (0.634 mi.)***	***8***	***12***

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990’s. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are

2 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

CUPA Listings: A listing of sites included in the county's Certified Unified Program Agency database. California's Secretary for Environmental Protection established the unified hazardous materials and hazardous waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 3 CUPA Listings sites within approximately 0.25 miles of the target property.

ORPHAN SUMMARY

City	EDR ID	Site Name	Site Address	Zip	Database(s)
CLOVIS	S121685278	TRACT NO 5045	SEC OF PEACH AND SHEPHERD		CIWQS

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA’s Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

	Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Date of Government Version: 11/14/2018

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016
Date Data Arrived at EDR: 01/05/2017

Data Release Frequency: Varies

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA’s Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Date of Government Version: 03/01/2018	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/28/2018	Telephone: (415) 495-8895

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

Date of Government Version: 03/01/2018	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/28/2018	Telephone: (415) 495-8895
Date Made Active in Reports: 06/22/2018	Last EDR Contact: 12/03/2018
Number of Days to Update: 86	Next Scheduled EDR Contact: 01/07/2019
	Data Release Frequency: Quarterly

RCRA-SQG: RCRA - Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

Date of Government Version: 03/01/2018	Source: Environmental Protection Agency
Date Data Arrived at EDR: 03/28/2018	Telephone: (415) 495-8895

Number of Days to Update: 86	Next Scheduled EDR Contact: 01/07/2019
	Data Release Frequency: Quarterly

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

Federal institutional controls / engineering controls registries

LUCIS: Land Use Control Information System

LUCIS contains records of land use control information pertaining to the former Navy Base Realignment and Closure properties.

Date of Government Version: 10/17/2018	Source: Department of the Navy
Date Data Arrived at EDR: 10/25/2018	Telephone: 843-820-7326
Date Made Active in Reports: 12/07/2018	Last EDR Contact: 10/15/2018
Number of Days to Update: 43	Next Scheduled EDR Contact: 02/25/2019
	Data Release Frequency: Varies

US ENG CONTROLS: Engineering Controls Sites List

A listing of sites with engineering controls in place. Engineering controls include various forms of caps, building foundations, liners, and treatment methods to create pathway elimination for regulated substances to enter environmental media or effect human health.

Date of Government Version: 07/31/2018	Source: Environmental Protection Agency
Date Data Arrived at EDR: 08/28/2018	Telephone: 703-603-0695
Date Made Active in Reports: 09/14/2018	Last EDR Contact: 11/28/2018
Number of Days to Update: 17	Next Scheduled EDR Contact: 03/11/2019
	Data Release Frequency: Varies

US INST CONTROL: Sites with Institutional Controls

A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

Date of Government Version: 07/31/2018	Source: Environmental Protection Agency
Date Data Arrived at EDR: 08/28/2018	Telephone: 703-603-0695
Date Made Active in Reports: 09/14/2018	Last EDR Contact: 11/28/2018
Number of Days to Update: 17	Next Scheduled EDR Contact: 03/11/2019
	Data Release Frequency: Varies

Federal ERNS list

ERNS: Emergency Response Notification System
Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 09/24/2018	Source: National Response Center, United States Coast Guard
Date Data Arrived at EDR: 09/25/2018	Telephone: 202-267-2180
Date Made Active in Reports: 11/09/2018	Last EDR Contact: 09/25/2018
Number of Days to Update: 45	Next Scheduled EDR Contact: 01/07/2019
	Data Release Frequency: Quarterly

State- and tribal - equivalent NPL

RESPONSE: State Response Sites
Identifies confirmed release sites where DTSC is involved in remediation, either in a lead or oversight capacity. These confirmed release sites are generally high-priority and high potential risk.

Date of Government Version: 10/29/2018	Source: Department of Toxic Substances Control
Date Data Arrived at EDR: 10/30/2018	Telephone: 916-323-3400
Date Made Active in Reports: 12/13/2018	Last EDR Contact: 10/30/2018
Number of Days to Update: 44	Next Scheduled EDR Contact: 02/11/2019
	Data Release Frequency: Quarterly

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database
The Department of Toxic Substances Control’s (DTSC’s) Site Mitigation and Brownfields Reuse Program’s (SMBRP’s) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

Date of Government Version: 10/29/2018	Source: Department of Toxic Substances Control
Date Data Arrived at EDR: 10/30/2018	Telephone: 916-323-3400
Date Made Active in Reports: 12/13/2018	Last EDR Contact: 10/30/2018
Number of Days to Update: 44	Next Scheduled EDR Contact: 02/11/2019
	Data Release Frequency: Quarterly

State and tribal landfill and/or solid waste disposal site lists

SWF/LF (SWIS): Solid Waste Information System
Active, Closed and Inactive Landfills. SWF/LF records typically contain an inventory of solid waste disposal facilities or landfills. These may be active or inactive facilities or open dumps that failed to meet RCRA Section 4004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 11/12/2018	Source: Department of Resources Recycling and Recovery
Date Data Arrived at EDR: 11/14/2018	Telephone: 916-341-6320
Date Made Active in Reports: 12/13/2018	Last EDR Contact: 11/14/2018
Number of Days to Update: 29	Next Scheduled EDR Contact: 02/25/2019

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 09/21/2018

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Date of Government Version: 09/04/2018	Source: DTSC and SWRCB
Date Data Arrived at EDR: 09/05/2018	Telephone: 916-323-3400

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA’s comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing

Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region’s active disposal pits are operating without permission.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association’s annual survey of hospitals.
Medical Centers: Provider of Services Listing

Version Date:	2012

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).

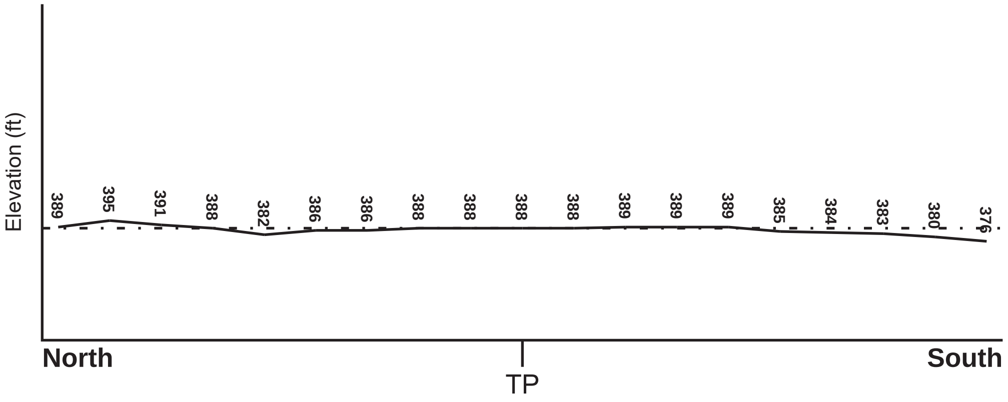
TOPOGRAPHIC INFORMATION

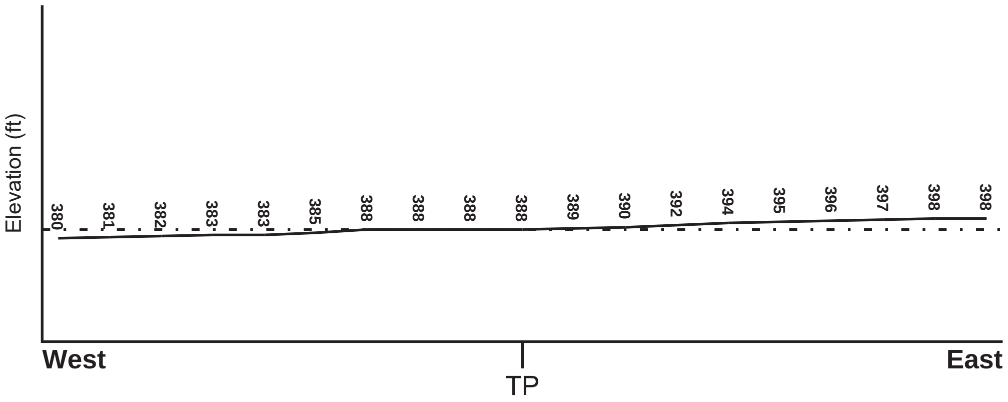
Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES





Target Property Elevation: 388 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

06019C1585H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CLOVIS	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name:	GRANGEVILLE
Soil Surface Texture:	fine sandy loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Somewhat poorly drained
Hydric Status: Partially hydric	
Corrosion Potential - Uncoated Steel:	High
Depth to Bedrock Min:	> 0 inches
Depth to Watertable Min:	> 153 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	**Upper**	**Lower**	**Soil Texture Class**	**AASHTO Group**	**Unified Soil**		**Soil Reaction (pH)**
1	0 inches	7 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.6
2	7 inches	59 inches	fine sandy loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 8.4 Min: 6.6

Soil Map ID: 2

Soil Component Name:	ATWATER
Soil Surface Texture:	sandy loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	
Layer	**Upper**	**Lower**	**Soil Texture Class**	**AASHTO Group**	**Unified Soil**		**Soil Reaction (pH)**
1	0 inches	24 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.3 Min: 6.6
2	24 inches	42 inches	sandy loam	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.3 Min: 6.6
3	42 inches	59 inches	loamy sand	Granular materials (35 pct. or less passing No. 200), Silty, or Clayey Gravel and Sand.	COARSE-GRAINED SOILS, Sands, Sands with fines, Silty Sand.	Max: 42 Min: 14	Max: 7.3 Min: 6.6

Soil Map ID: 3

Soil Component Name: RAMONA

Soil Surface Texture: loam

Hydrologic Group: Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

TOPOGRAPHIC INFORMATION

USGS 7.5’ Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5’ Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture’s (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

TABLE OF CONTENTS

LIST OF APPENDICES

LIST OF EXHIBITS

LIST OF TABLES

1.0 Introduction

1.1 Purpose of Analysis and Study Objectives

The purpose of this noise impact study is to evaluate the potential noise impacts for the project study area and compare results to City and CEQA thresholds. The assessment was conducted and compared to the noise standards set forth by the Federal, State, and Local agencies. Consistent with the California Environmental Quality Act (CEQA) and CEQA Guidelines, a significant impact related to noise would occur if a proposed project is determined to result in:

- Exposure of persons to or generation of noise levels in excess of standards established in the local General Plan or noise ordinance, or applicable agencies.
- Exposure of persons to or generation of excessive ground-borne vibration or ground-borne noise levels.
- A substantial permanent increase in ambient noise levels in the project vicinity above levels existing without the Project.
- A substantial temporary or periodic increase in ambient noise levels in the project vicinity above levels existing without the Project.

The following is provided in this report:

- A description of the study area and the proposed Project
- Information regarding the fundamentals of noise
- A description of the local noise guidelines and standards
- An evaluation of the existing ambient noise environment
- An analysis of the traffic noise impacts to the project site
- An evaluation of the interior noise limit compliance
- Construction noise and vibration evaluation

1.2 Site Location and Study Area

The Project site is bounded by E Shepherd Ave. to the south, Sunnyside Ave. to the west, residential along Lexington and N Purdue Ave. to the northwest, residential along Perrin Rd. and N Stanford Ave. to the north, and residential along N Fowler Ave. to the south, as shown in Exhibit A. The City of Clovis General Plan classifies the site's land use designation as Rural Residential (RR).

1.3 Proposed Project Description

The Project would include a request to amend the City's 2014 General Plan to re-designate the Project site (approximately 75 acres) from the Rural Residential (1 DU/2 ac) land use designation to the Medium Density Residential (4.1 to 7.0 DU/ac) land use designation as well as include the sphere of influence (SOI) Expansion Area of 1,050 acres.

Although the number of residential units is not yet known, the Medium Density designation allows a density between 4.1 and 7.0 dwelling units per acre. Therefore, the environmental analysis should assume construction of up to a maximum of 525 residential units on the 75-acre Project site within the City of Clovis.

For this Project, a Project Level EIR would be prepared for the 75-acre project site, and a programmatic EIR Level of Analysis would be prepared for the remaining area. The general plan amendment would also include a request to allow for access to Shepherd Avenue, which is currently designated as an "expressway" in the Clovis General Plan. The site plan for the Project is shown in Exhibit B.

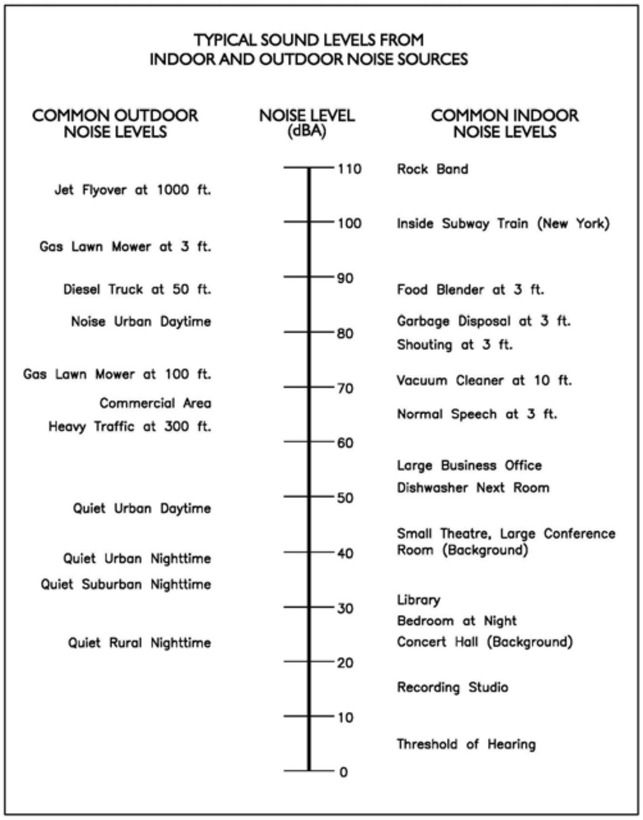
2.0 Fundamentals of Noise

This section of the report provides basic information about noise and presents some of the terms used in the report.

2.1 Sound, Noise and Acoustics

Sound is a disturbance created by a moving or vibrating source and is capable of being detected by the hearing organs. Sound may be thought of as mechanical energy of a moving object transmitted by pressure waves through a medium to a human ear. For traffic or stationary noise, the medium of concern is air. *Noise* is defined as sound that is loud, unpleasant, unexpected, or unwanted.

Exhibit C: Typical A-Weighted Noise Levels



2.2 Frequency and Hertz

A continuous sound is described by its *frequency* (pitch) and its *amplitude* (loudness). Frequency relates to the number of pressure oscillations per second. Low-frequency sounds are low in pitch (bass sounding) and high-frequency sounds are high in pitch (squeak). These oscillations per second (cycles) are commonly referred to as Hertz (Hz). The human ear can hear from the bass pitch starting out at 20 Hz all the way to the high pitch of 20,000 Hz.

2.3 Sound Pressure Levels and Decibels

The *amplitude* of a sound determines its loudness. The loudness of sound increases or decreases as the amplitude increases or decreases. Sound pressure amplitude is measured in units of micro-Newton per square inch meter ($\mu N/m^2$), also called micro-Pascal (µPa). One µPa is approximately one hundred billionths (0.00000000001) of normal atmospheric pressure. Sound pressure level (SPL or L_p) is used to describe in logarithmic units the ratio of actual sound pressures to a reference pressure squared. These units are called decibels, abbreviated dB. Exhibit C illustrates references sound levels for different noise sources.

2.4 Addition of Decibels

Because decibels are on a logarithmic scale, sound pressure levels cannot be added or subtracted by simple plus or minus addition. When two sounds or equal SPL are combined, they will produce an SPL 3 dB greater than the original single SPL. In other words, sound energy must be doubled to produce a 3 dB increase. If two sounds differ by approximately 10 dB, the higher sound level is the predominant sound.

2.5 Human Response to Changes in Noise Levels

In general, the healthy human ear is most sensitive to sounds between 1,000 Hz and 5,000 Hz, and it perceives a sound within that range as being more intense than a sound with a higher or lower frequency with the same magnitude. For purposes of this report as well as with most environmental documents, the A-scale weighting is typically reported in terms of A-weighted decibel (dBA), a scale designed to account for the frequency-dependent sensitivity of the ear. Typically, the human ear can barely perceive a change in noise level of 3 dB. A change in 5 dB is readily perceptible, and a change in 10 dB is perceived as being twice or half as loud. As previously discussed, a doubling of sound energy results in a 3 dB increase in sound, which means that a doubling of sound energy (e.g., doubling the volume of traffic on a highway) would result in a barely perceptible change in sound level.

2.6 Noise Descriptors

Noise in our daily environment fluctuates over time. Some noise levels occur in regular patterns; others are random. Some noise levels are constant while others are sporadic. Noise descriptors were created to describe the different time-varying noise levels.

A-Weighted Sound Level: The sound pressure level in decibels as measured on a sound level meter using the A-weighted filter network. The A-weighting filter de-emphasizes the very low and very high-frequency components of the sound in a manner similar to the response of the human ear. A numerical method of rating human judgment of loudness.

Ambient Noise Level: The composite of noise from all sources, near and far. In this context, the ambient noise level constitutes the normal or existing level of environmental noise at a given location.

Community Noise Equivalent Level (CNEL): The average equivalent A-weighted sound level during a 24-hour day, obtained after the addition of five (5) decibels to sound levels in the evening from 7:00 to 10:00 PM and after the addition of ten (10) decibels to sound levels in the night before 7:00 AM and after 10:00 PM.

Decibel (dB): A unit for measuring the amplitude of a sound, equal to 20 times the logarithm to the base 10 of the ratio of the pressure of the sound measured to the reference pressure, which is 20 micro-pascals.

dB(A): A-weighted sound level (see definition above).

Equivalent Sound Level (LEQ): The sound level corresponding to a steady noise level over a given sample period with the same amount of acoustic energy as the actual time-varying noise level. The energy average noise level during the sample period.

Habitable Room: Any room meeting the requirements of the Uniform Building Code or other applicable regulations, which is intended to be used for sleeping, living, cooking, or dining purposes, excluding such enclosed spaces as closets, pantries, bath or toilet rooms, service rooms, connecting corridors, laundries, unfinished attics, foyers, storage spaces, cellars, utility rooms, and similar spaces.

L(n): The A-weighted sound level exceeded during a certain percentage of the sample time. For example, L10 in the sound level exceeded 10 percent of the sample time. Similarly L50, L90, and L99, etc.

Noise: *A*ny unwanted sound or sound which is undesirable because it interferes with speech and hearing, or is intense enough to damage hearing, or is otherwise annoying. The State Noise Control Act defines noise as "...excessive undesirable sound...".

Outdoor Living Area: Outdoor spaces that are associated with residential land uses typically used for passive recreational activities or other noise-sensitive uses. Such spaces include patio areas, barbecue areas, jacuzzi areas, etc. associated with residential uses; outdoor patient recovery or resting areas associated with hospitals, convalescent hospitals, or rest homes; outdoor areas associated with places of worship which have a significant role in services or other noise-sensitive activities; and outdoor school facilities routinely used for educational purposes which may be adversely impacted by noise. Outdoor areas usually not included in this definition are: front yard areas, driveways, greenbelts, maintenance areas and storage areas associated with residential land uses; exterior areas at hospitals that are not used for patient activities; outdoor areas associated with places of worship and principally used for short-term social gatherings; and, outdoor areas associated with school facilities that are not typically associated with educational uses prone to adverse noise impacts (for example, school play yard areas).

Percent Noise Levels: See L(n).

Sound Level (Noise Level): The weighted sound pressure level obtained by use of a sound level meter having a standard frequency filter for attenuating part of the sound spectrum.

Sound Level Meter: An instrument, including a microphone, an amplifier, an output meter, and frequency weighting networks for the measurement and determination of noise and sound levels.

Single Event Noise Exposure Level (SENEL): The dB(A) level which, if it lasted for one second, would produce the same A-weighted sound energy as the actual event.

2.7 Traffic Noise Prediction

Noise levels associated with traffic depends on a variety of factors: (1) volume of traffic, (2) speed of traffic, (3) auto, medium truck (2–3 axle) and heavy truck percentage (4 axle and greater), and sound propagation. The greater the volume of traffic, higher speeds and truck percentages equate to a louder volume in noise. A doubling of the Average Daily Traffic (ADT) along a roadway will increase noise levels by approximately 3 dB; reasons for this are discussed in the sections above.

2.8 Sound Propagation

As sound propagates from a source, it spreads geometrically. Sound from a small, localized source (i.e., a point source) radiates uniformly outward as it travels away from the source in a spherical pattern. The sound level attenuates at a rate of 6 dB per doubling of distance. The movement of vehicles down a roadway makes the source of the sound appear to propagate from a line (i.e., line source) rather than a point source. This line source results in the noise propagating from a roadway in a cylindrical spreading versus a spherical spreading that results from a point source. The sound level attenuates for a line source at a rate of 3 dB per doubling of distance.

As noise propagates from the source, it is affected by the ground and atmosphere. Noise models use hard site (reflective surfaces) and soft site (absorptive surfaces) to help calculate predicted noise levels. Hard site conditions assume no excessive ground absorption between the noise source and the receiver. Soft site conditions such as grass, soft dirt or landscaping attenuate noise at a rate of 1.5 dB per doubling of distance. When added to the geometric spreading, the excess ground attenuation results in an overall noise attenuation of 4.5 dB per doubling of distance for a line source and 7.5 dB per doubling of distance for a point source.

Research has demonstrated that atmospheric conditions can have a significant effect on noise levels when noise receivers are located 200 feet from a noise source. Wind, temperature, air humidity, and turbulence can further impact have far sound can travel.

3.0 Ground-Borne Vibration Fundamentals

3.1 Vibration Descriptors

Ground-borne vibrations consist of rapidly fluctuating motions within the ground that have an average motion of zero. The effects of ground-borne vibrations typically only cause a nuisance to people, but at extreme vibration levels, damage to buildings may occur. Although ground-borne vibration can be felt outdoors, it is typically only an annoyance to people indoors, where the associated effects of the shaking of a building can be notable. Ground-borne noise is an effect of ground-borne vibration and only exists indoors since it is produced from noise radiated from the motion of the walls and floors of a room and may also consist of the rattling of windows or dishes on shelves.

Several different methods are used to quantify vibration amplitude.

PPV – Known as the peak particle velocity (PPV), which is the maximum instantaneous peak in vibration velocity, typically given in inches per second.

RMS – Known as root mean squared (RMS) can be used to denote vibration amplitude

VdB – A commonly used abbreviation to describe the vibration level (VdB) for a vibration source.

3.2 Vibration Perception

Typically, developed areas are continuously affected by vibration velocities of 50 VdB or lower. These continuous vibrations are not noticeable to humans, whose threshold of perception is around 65 VdB. Outdoor sources that may produce perceptible vibrations are usually caused by construction equipment, steel-wheeled trains, and traffic on rough roads, while smooth roads rarely produce perceptible ground-borne noise or vibration. To counter the effects of ground-borne vibration, the Federal Transit Administration (FTA) has published guidance relative to vibration impacts. According to the FTA, fragile buildings can be exposed to ground-borne vibration levels of 0.3 inches per second without experiencing structural damage.

3.3 Vibration Propagation

There are three main types of vibration propagation: surface, compression, and shear waves. Surface waves, or Rayleigh waves, travel along the ground's surface. These waves carry most of their energy along an expanding circular wavefront, similar to ripples produced by throwing a rock into a pool of water. P-waves, or compression waves, are body waves that carry their energy along an expanding spherical wavefront. The particle motion in these waves is longitudinal (i.e., in a "push-pull" fashion). P-waves are analogous to airborne sound waves. S-waves, or shear waves, are also body waves that carry energy along an expanding spherical wavefront. However, unlike P-waves, the particle motion is transverse, or side-to-side and perpendicular to the direction of propagation.

As vibration waves propagate from a source, the vibration energy decreases in a logarithmic nature and the vibration levels typically decrease by 6 VdB per doubling of the distance from the vibration source. As stated above, this drop-off rate can vary greatly depending on the soil but has been shown to be effective enough for screening purposes, in order to identify potential vibration impacts that may need to be studied through actual field tests.

4.0 Regulatory Setting

The proposed Project is located within the City of Clovis, California and noise regulations are addressed through the efforts of various federal, state and local government agencies. The agencies responsible for regulating noise are discussed below.

4.1 Federal Regulations

The adverse impact of noise was officially recognized by the federal government in the Noise Control Act of 1972, which serves three purposes:

- Publicize noise emission standards for interstate commerce
- Assist state and local abatement efforts
- Promote noise education and research

The Federal Office of Noise Abatement and Control (ONAC) originally was tasked with implementing the Noise Control Act. However, it was eventually eliminated leaving other federal agencies and committees to develop noise policies and programs. Some examples of these agencies are as follows: The Department of Transportation (DOT) assumed a significant role in noise control through its various agencies. The Federal Aviation Agency (FAA) is responsible for regulating noise from aircraft and airports. The Federal Highway Administration (FHWA) is responsible for regulating noise from the interstate highway system. The Occupational Safety and Health Administration (OSHA) is responsible for the prohibition of excessive noise exposure to workers. The Housing and Urban Development (HUD) is responsible for establishing noise regulations as it relates to exterior/interior noise levels for new HUD-assisted housing developments near high noise areas.

The federal government advocates that local jurisdictions use their land use regulatory authority to arrange new development in such a way that "noise sensitive" uses are either prohibited from being constructed adjacent to a highway, or alternatively that the developments are planned and constructed in such a manner that potential noise impacts are minimized.

Since the federal government has preempted the setting of standards for noise levels that can be emitted by the transportation source, the City is restricted to regulating the noise generated by the transportation system through nuisance abatement ordinances and land use planning.

4.2 State Regulations

Established in 1973, the California Department of Health Services Office of Noise Control (ONC) was instrumental in developing regularity tools to control and abate noise for use by local agencies. One significant model is the "Land Use Compatibility for Community Noise Environments Matrix." The matrix allows the local jurisdiction to clearly delineate compatibility of sensitive uses with various incremental levels of noise.

The State of California has established noise insulation standards as outlined in Title 24, the California Building Code (CBC) which in some cases requires acoustical analyses to outline exterior noise levels and to ensure interior noise levels do not exceed the interior threshold. The State mandates that the legislative body of each county and City adopt a noise element as part of its comprehensive general plan. The local noise element must recognize the land use compatibility guidelines published by the State Department of Health Services.

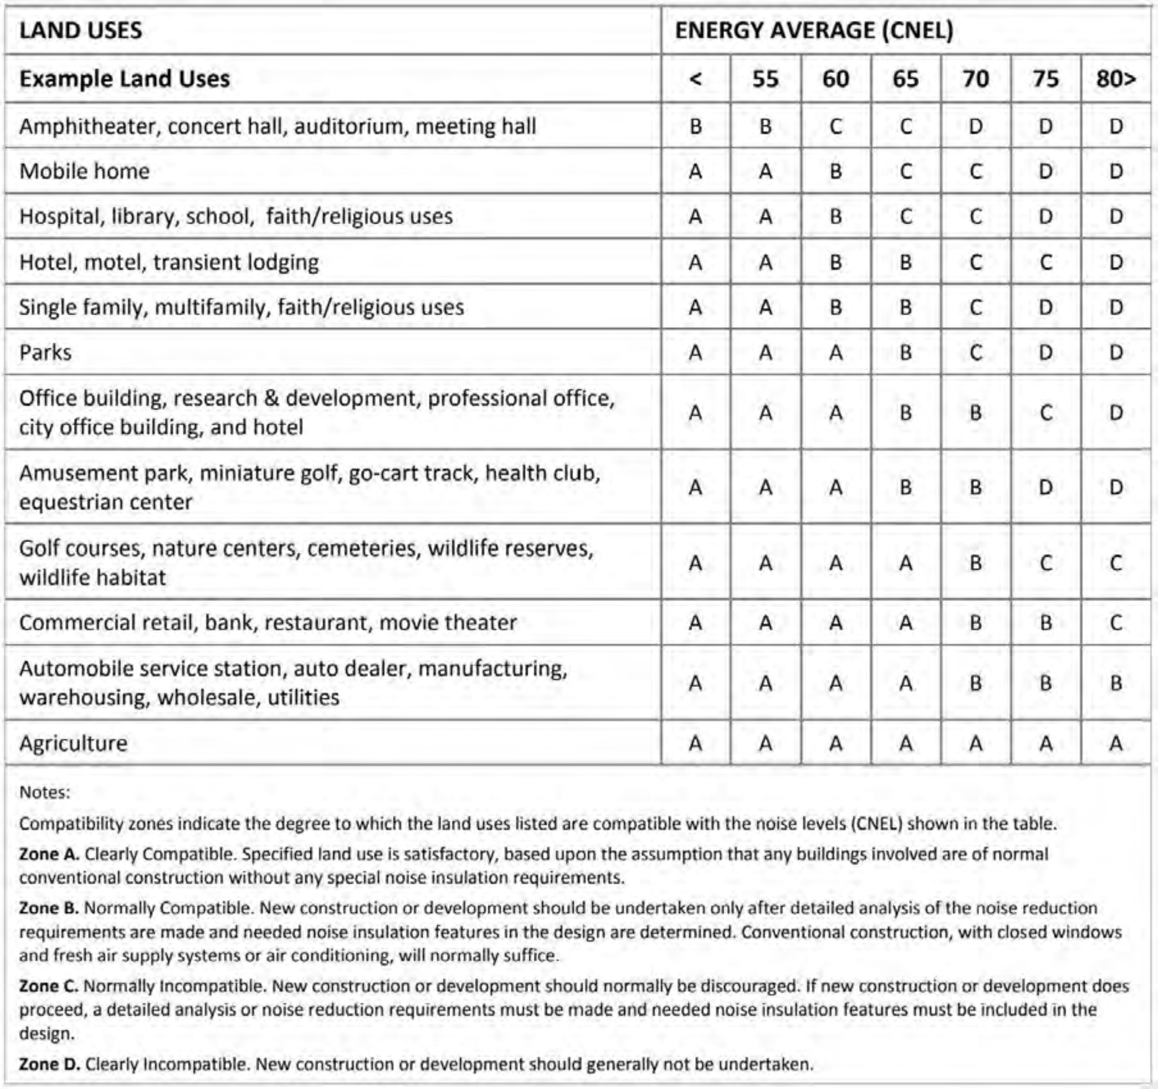
4.3 City of Clovis Noise Regulations

The City of Clovis outlines their noise regulations and standards within the General Plan Environmental Safety Element and the Noise Ordinance from the Municipal Code.

City of Clovis General Plan

Applicable policies and standards governing environmental noise in the City are set forth in the General Plan Environmental Safety Element. The guidelines rank noise land use compatibility in terms of clearly compatible, normally compatible, normally incompatible, and clearly incompatible as illustrated in Exhibit D.

Exhibit D: Land Use and Noise Compatibility Matrix



LAND USES	**ENERGY AVERAGE (CNEL)**						
Example Land Uses	**<**	**55**	**60**	**65**	**70**	**75**	**80>**
Amphitheater, concert hall, auditorium, meeting hall	B	B	C	C	D	D	D
Mobile home	A	A	B	C	C	D	D
Hospital, library, school, faith/religious uses	A	A	B	C	C	D	D
Hotel, motel, transient lodging	A	A	B	B	C	C	D
Single family, multifamily, faith/religious uses	A	A	B	B	C	D	D
Parks	A	A	A	B	C	D	D
Office building, research & development, professional office, city office building, and hotel	A	A	A	B	B	C	D
Amusement park, miniature golf, go-cart track, health club, equestrian center	A	A	A	B	B	D	D
Golf courses, nature centers, cemeteries, wildlife reserves, wildlife habitat	A	A	A	A	B	C	C
Commercial retail, bank, restaurant, movie theater	A	A	A	A	B	B	C
Automobile service station, auto dealer, manufacturing, warehousing, wholesale, utilities	A	A	A	A	B	B	B
Agriculture	A	A	A	A	A	A	A

Notes:

Compatibility zones indicate the degree to which the land uses listed are compatible with the noise levels (CNEL) shown in the table.

Zone A. Clearly Compatible. Specified land use is satisfactory, based upon the assumption that any buildings involved are of normal conventional construction without any special noise insulation requirements.

Zone B. Normally Compatible. New construction or development should be undertaken only after detailed analysis of the noise reduction requirements are made and needed noise insulation features in the design are determined. Conventional construction, with closed windows and fresh air supply systems or air conditioning, will normally suffice.

Zone C. Normally Incompatible. New construction or development should normally be discouraged. If new construction or development does proceed, a detailed analysis or noise reduction requirements must be made and needed noise insulation features must be included in the design.

Zone D. Clearly Incompatible. New construction or development should generally not be undertaken.

The General Plan also outlines an acceptable exterior level of 65 dBA CNEL and an interior level of 45 dBA CNEL (windows closed) for residential uses. The City has outlined goals, policies, and implementation measures to reduce potential noise impacts which are presented below:

Goals, Policies, and Implementation Measures

Policies, goals, and implementation program measures from the Policy Plan that would mitigate potential impacts on noise include the following.

Goal 3: An environment in which minimized noise contributes to the public's health, safety, and welfare.

> Policy 3.1 Land use compatibility. Approve development and require mitigation measures to ensure existing and future land use compatibility as shown in the Noise Level Exposure and Land Use Compatibility Matrix and the City's noise ordinance.
>
> Policy 3.2 Land use and traffic patterns. Discourage land use and traffic patterns that would expose sensitive land uses or noise-sensitive areas to unacceptable noise levels.
>
> Policy 3.3 New residential. When new residential development is proposed adjacent to land designated for industrial or commercial uses, require the proposed development to assess potential noise impacts and fund feasible noise-related mitigation measures.
>
> Policy 3.4 Acoustical study. Require an acoustical study for proposed projects that have the potential to exceed acceptable noise thresholds or are exposed to existing or future noise levels in excess of the thresholds in the City's noise ordinance.
>
> Policy 3.5 Site and building design. Minimize noise impacts by requiring appropriate site, circulation, equipment, and building design, and sound walls, landscaping, and other buffers.
>
> Policy 3.6 Noise impacts. Minimize or eliminate persistent, periodic, or impulsive noise impacts of business operations.
>
> Policy 3.7 Mixed-use buildings. Require that mixed-use structures be designed to prevent transfer of noise and vibration between uses.
>
> Policy 3.8 Existing uses. Require the use of noise abatement devices for existing uses that exceed acceptable noise thresholds.
>
> Policy 3.9 Caltrans facilities. Coordinate with Caltrans to ensure the inclusion of noise mitigation measures in the design of new highway projects or improvements to existing facilities.
>
> Policy 3.10 Airport changes. Coordinate with the Fresno Yosemite International Airport to minimize noise impacts on properties in Clovis due to changes in flight patterns or airport expansion.
>
> Policy 3.11 Airport land use compatibility. Approve land uses in a manner that is consistent with the Fresno Yosemite International Airport Land Use Compatibility Plan.
>
> Policy 3.12 Truck traffic. Plan and maintain truck routes that avoid noise-sensitive land uses and areas. Encourage business delivery areas to be located away from residential properties and to mitigate associated noise impacts.

Policy 3.13 Small aircraft and helicopters. Minimize the noise impact of small aircraft and helicopters on residential neighborhoods.

Policy 3.14 Control sound at the source. Prioritize using noise mitigation measures to control sound at the source before buffers, soundwalls, and other perimeter measures.

City of Clovis– Noise Ordinance/Municipal Code

Chapter 9.22.080 and 9.22.100 General Performance Standards of the City's Municipal Code outlines the City's noise ordinance.

Section 9.22.080 –Noise

D. Noise standards. The following noise standards, unless otherwise specifically indicated, shall apply to all property with a designated noise zone:

MAXIMUM EXTERIOR NOISE STANDARDS

Noise Zone	**Type of Land Use**	**Allowable Exterior Noise Level (15-Minute Leq)**	
		7 a.m. to 10 p.m.	**10 p.m. to 7 a.m.**
I	Single-, two- or multiple-family residential	55 dBA	50 dBA
II	Commercial	65 dBA	60 dBA
III	Residential portions of mixed use properties	60 dBA	50 dBA
IV	Industrial or manufacturing	70 dBA	70 dBA

MAXIMUM INTERIOR NOISE STANDARDS

Noise Zone	**Type of Land Use**	**Allowable Exterior Noise Level (15-Minute Leq)**	
		7 a.m. to 10 p.m.	**10 p.m. to 7 a.m.**
I	Residential	45 dBA	40 dBA
II	Administrative/professional office	50 dBA	—
III	Residential portions of mixed use properties	45 dBA	40 dBA

1. If the ambient noise level exceeds the resulting standard, the ambient shall be the standard.

2. It is unlawful for any person to create any noise, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which causes the noise level when measured on any property measured at the property line, to exceed either of the following within the incorporated area of the City:

   a. The noise standard for the applicable zone for any fifteen (15) minute period;

b. A maximum impulsive noise level equal to the value of the noise standard plus twenty (20) dBA for any period of time (measured using A-weighted slow response). Impulsive noise which repeats four (4) or more times in any hour between 10:00 p.m. and 7:00 a.m. shall be measured as continuous sound and meet the noise standard for the applicable zone.

3. When properties of two (2) different noise zones abut one another, the maximum exterior noise level shall be the lower of the two (2) noise zones where one zone is residential, and in other contexts shall be the average of the two (2) zones.

4. Commercial, industrial, and recreational uses which create impulsive noise as part of their regular processes, such as through the use of pile drivers, forge hammers, punch presses, and gunshots, shall not be located in any zone district adjacent to a residential zone district unless a noise study is completed demonstrating the impulsive noise does not exceed the standards at the property line for the residential zone district. Impulse noise from these uses shall be measured as continuous sound. The noise study shall be subject to review and approval by the Director or his or her designee, and shall be completed as part of any discretionary permit process for the use or prior to obtaining a building permit. This provision shall not apply to uses existing on the effective date of the ordinance codified in this title.

5. Emergency electrical generators in residential zone districts shall comply with the California Building Code and California Residential Code, as amended, for the installation and operation of the emergency generator. Test cycle operation shall be limited to the hours between 10:00 a.m. and 4:00 p.m. Emergency electrical generators are intended to provide emergency power to run air conditioning, medical equipment and other household appliances in the event of a rolling blackout or other power grid failure.

E. Measurement of sound levels. Measurement of sound levels shall be as follows:

1. Sound level meter. Sound levels shall be measured on the A-weighting network of a sound level meter meeting the requirements of ASA Standards S14-1971 for General Purpose Sound Level Meters, or the latest revision published by the American National Standards Institute, Inc., using the slow meter response. The meter shall be calibrated and used according to the manufacturer's instructions.

2. Location of microphone. Measurements shall be taken with the microphone located at any point on the property line of the noise source, but no closer than three feet (3') from any wall and not less than three feet (3') above the ground.

3. Minimum of two (2) readings. A minimum of two (2) readings shall be taken for a period of ten (10) minutes each with ten (10) minute intervals between measurements. The sound level shall be the average of these readings.

F. Activities exempt from regulations. The following activities shall be exempt from the provisions of this section:

1. Emergency exemption. The emission of sound for the purpose of alerting persons to the existence of an emergency, or the emission of sound in the performance of emergency work.

2. Warning devices. Warning devices necessary for the protection of public safety, (e.g., ambulance, fire, and police sirens, and train horns).

3. Railroad activities. All locomotives and rail cars operated by a railroad that is regulated by the State Public Utilities Commission.

4. Federal or State pre-exempted activities. Any activity, to the extent regulation thereof has been pre-exempted by Federal or State law.

5. Pre-existing uses. Uses existing at the time of the effective date of the ordinance codified in this title, which are in compliance with all applicable standards in effect prior to adoption, and which are not otherwise operating as a nuisance in violation of Article 6 of Chapter 27 of Title 5.

6. Public health and safety activities. All transportation, flood control, and utility maintenance and construction operations conducted by government entities or utility companies at any time on public rights-of-way, and those situations that may occur on private property deemed necessary to serve the best interests of the public and to protect the public's health and well-being, including, but not limited to: debris and limb removal; removal of damaged poles and vehicles; removal of downed wires; restoring electrical service; repairing traffic signals; repair of water hydrants; repair of mains, gas lines, oil lines, and sewers; repair and maintenance of flood control and storm water facilities; repair and maintenance of streets and sidewalks.

7. Ordinary municipal activities. Ordinary municipal activities conducted by the City or other entity having jurisdiction in the City, including, but not limited to: solid waste collection; street sweeping; operation, maintenance, and repair of water production, treatment, and distribution facilities; operation, maintenance, and repair of sewage treatment, collection and distribution facilities; and vacuuming catch basins.

8. Public safety training activities. Training activities by fire, law enforcement, and public utility officials that cannot reasonably take place within the parameters of this section, including but not limited to training that involves: hydrant testing, pumping hose lays, running chain saws, operating power tools, demolition, vehicle noise, and use of generators.

9. Public celebrations. Public celebrations, holidays, or occasions generally celebrated, or public parades held under authorized permits; any sporting event or activity conducted under the direction and supervision of any public or private school.

G. Acts deemed violations of section. The following acts are a violation of this section:

1. Noise-related nuisances defined in Chapter 27 of Title 5. Violations of Article 6 of Chapter 27 of Title 5 pertaining to unlawful noise-related nuisances shall also be considered a violation of this section.

2. Construction noise. Construction activities shall be subject to the provisions of Section 5.27.604, which sets forth the permissible hours for construction activity. At all other times, no person shall operate, or cause to be operated, tools or equipment used in alteration, construction, demolition, drilling, or repair work so that the sound creates a noise disturbance across a residential property line, except for emergency work. Stationary equipment (e.g., generators) shall not be located adjacent to any existing residences unless enclosed in a noise attenuating structure, subject to the review and approval of the Director.

3. Places of public entertainment. Operating, playing, or allowing the operation or playing of a drum, musical instrument, phonograph, radio, sound amplifier, television, or similar device that produces, reproduces, or amplifies sound in a place of public entertainment at a sound level greater than ninety-five (95) dBA (read by the slow response on a sound level meter) at any point that is normally occupied by a customer is prohibited, unless conspicuous signs are located near each public entrance, stating "Warning: Sound Levels Within May Cause Hearing Impairment."

4. Stationary nonemergency signaling devices. Sounding or allowing the sounding of an electronically amplified signal from a stationary bell, chime, siren, whistle, or similar device intended primarily for nonemergency purposes, from any place, for more than ten (10) consecutive seconds in any hourly period is prohibited.

5. Compacting mechanisms. Operating or allowing the operation of the compacting mechanism of any motor vehicle that compacts refuse and that creates, during the compacting cycle, a sound level in excess of eighty-five (85) dBA when measured at fifty feet (50') from any point of the vehicle is prohibited between the hours of 9:00 p.m. and 5:00 a.m.

6. Vehicle or motorboat repairs and testing. Repairing, rebuilding, modifying, or testing any motor vehicle, motorcycle, or motorboat in a manner as to cause a noise disturbance across property lines or within a noise-sensitive zone is prohibited.

H. Responsibility to eliminate or reduce acts deemed violations of section. Improvements to eliminate or reduce negative impacts between uses deemed violations of this section shall be provided by the new use, rather than the existing use. (§ 2, Ord. 14-13, eff. October 8, 2014; § 1(2) (Atts. 1, 2), Ord. 20-18, eff. February 3, 2021)

9.22.100 Vibrations.

Uses that generate vibrations that may be considered a nuisance or hazard on any adjacent property shall be corrected, cushioned, or isolated to prevent the continued generation of vibrations. Uses shall be operated in compliance with the following provisions:

A. Not perceptible along property line. Uses shall not generate ground vibration that is perceptible without instruments by the average person at any point along or beyond the property line of the parcel containing the activities which generate the vibration.

B. No discomfort or annoyance. Uses, activities, and processes shall not generate ground vibration that causes discomfort or annoyance to reasonable persons of normal sensitivity or which endangers the comfort, health, or peace of residents whose property abuts the property lines of the subject parcel.

C. No interference. Uses shall not generate ground vibration that interferes with the operations of equipment and facilities on adjoining parcels.

D. Temporary construction exempt. Vibrations from temporary construction/demolition and vehicles that leave the subject parcel (e.g., trucks) are exempt from the provisions of this section. (§ 2, Ord. 14-13, eff. October 8, 2014)

5.0 Study Method and Procedure

The following section describes the noise modeling procedures and assumptions used for this assessment.

5.1 Noise Measurement Procedure and Criteria

Noise measurements are taken to determine the existing noise levels. A noise receiver or receptor is any location in the noise analysis in which noise might produce an impact. The following criteria are used to select measurement locations and receptors:

- Locations expected to receive the highest noise impacts, such as the first row of houses
- Locations that are acoustically representative and equivalent to the area of concern
- Human land usage
- Sites clear of major obstruction and contamination

MD conducted the sound level measurements in accordance with the City's and Caltrans's (TeNS) technical noise specifications. All measurement equipment meets American National Standards Institute (ANSI) specifications for sound level meters (S1.4-1983 identified in Chapter 19.68.020.AA). The following gives a brief description of the Caltrans Technical Noise Supplement procedures for sound level measurements:

- Microphones for sound level meters were placed 5 feet above the ground for all measurements
- Sound level meters were calibrated (Larson Davis CAL 200) before and after each measurement
- Following the calibration of equipment, a windscreen was placed over the microphone
- Frequency weighting was set on "A" and slow response
- Results of the long-term noise measurements were recorded on field data sheets
- During any short-term noise measurements, any noise contaminations such as barking dogs, local traffic, lawnmowers, or aircraft fly-overs were noted
- Temperature and sky conditions were observed and documented

5.2 Noise Measurement Locations

Noise monitoring locations were selected based on the nearest sensitive receptors relative to the proposed onsite noise sources. Three (3) short-term 15-min noise measurement was conducted at or near the project site and are illustrated in Exhibit E. Appendix A includes photos, a field sheet, and measured noise data.

5.3 FHWA Traffic Noise Prediction Model

Traffic noise from vehicular traffic was projected using a computer program that replicates the FHWA Traffic Noise Prediction Model (FHWA-RD-77-108). The FHWA model arrives at the predicted noise level through a series of adjustments to the Reference Energy Mean Emission Level (REMEL). Roadway volumes correspond to the LSA Associates, Inc. segment projections. It's assumed that the peak hour is 10% of the ADT. The referenced traffic data was applied to the model and is in Appendix B. The following outlines the key adjustments made to the REMEL for the roadway inputs:

- Roadway classification – (e.g., freeway, major arterial, arterial, secondary, collector, etc.),
- Roadway Active Width – (distance between the center of the outermost travel lanes on each side of the roadway)
- Average Daily Traffic Volumes (ADT), Travel Speeds, Percentages of automobiles, medium trucks, and heavy trucks
- Roadway grade and angle of view
- Site Conditions (e.g., soft vs. hard)
- Percentage of total ADT which flows each hour throughout a 24-hour period

Table 1 indicates the vehicle distribution utilized for this study.

Table 1: Roadway Vehicle Distribution (Truck Mix)

Motor-Vehicle Type	Daytime % (7AM to 7 PM)	Evening % (7 PM to 10 PM)	Night % (10 PM to 7 AM)	Total % of Traffic Flow
Automobiles	75.5	14.0	10.5	97.42
Medium Trucks	48.9	2.2	48.9	1.84
Heavy Trucks	47.3	5.4	47.3	0.74

Notes:
[1] Traffic count from LSA Associates, Inc.

MD utilized segment projections from LSA Associates, Inc. obtained January 2023.

The following outlines key adjustments to the REMEL for project site parameter inputs:

- Vertical and horizontal distances (Sensitive receptor distance from noise source)
- Noise barrier vertical and horizontal distances (Noise barrier distance from sound source and receptor).
- Traffic noise source spectra
- Topography

5.4 FHWA Roadway Construction Noise Model

The construction noise analysis utilizes the Federal Highway Administration (FHWA) Roadway Construction Noise Model (RNCM), together with several key construction parameters. Key inputs include distance to the sensitive receiver, equipment usage, % usage factor, and baseline parameters for the project site.

The Project was analyzed based on the different construction phases. Construction noise is expected to be loudest during the grading, concrete, and building phases of construction. The construction noise calculation output worksheet is located in Appendix C.

Exhibit E

Noise Measurement Location Map

Figure 2.0-4. Accessor Parcel Map

X = Short-Term Measurement (15-MInute)

6.0 Existing Noise Environment

Three (3) 15-min ambient noise measurements were conducted at or near the property site. The noise measurements were taken to determine the existing ambient noise levels. Noise data indicates that traffic along Shepherd Avenue is the primary source of noise impacting the site and the adjacent uses. This assessment utilizes the ambient noise data as a basis and compares project operational levels to said data.

6.1 Short-Term Noise Measurement Results

The results of the short-term noise data are presented in Table 2.

Table 2: Short-Term Noise Measurement Data[1]

Date	Time	1-Hour dB(A)							
		L_{EQ}	L_{MAX}	L_{MIN}	L_2	L_8	L_{25}	L_{50}	L_{90}
12/20/2022	7:53AM-8:08AM	46.4	68.0	38.0	53.3	46.9	45.2	43.9	41.6
12/20/2022	8:27AM-8:42AM	69.1	82.2	55.7	77.4	72.0	68.7	66.4	62.6
12/20/2022	9:01AM-9:16AM	46.0	63.5	34.5	56.8	48.8	39.4	37.3	35.6

Notes:
[1] Short-term noise monitoring locations are illustrated in Exhibit E.

Noise data indicates the ambient noise level ranged from 46 to 69 dBA Leq at the project site. Maximum levels reached up to 82 dBA at location 2 as a result of traffic of heavy trucks along Shepherd Avenue. Additional field notes and photographs are provided in Appendix A.

6.2 Airport Noise Contours

The Project is outside the Fresno Yosemite International Airport Contours, as shown in Figure ES-5 of the 2014 Clovis General Plan.

7.0 Future Noise Environment Impacts

This assessment analyzes future noise impacts as a result of the Project. The analysis details the estimated exterior noise levels.

7.1 Future Exterior Noise

The following outlines the exterior noise levels associated with the proposed Project:

7.1.1 Noise Impacts to Off-Site Receptors Due to Project Generated Traffic

A worst-case project-generated traffic noise level was modeled utilizing the FHWA Traffic Noise Prediction Model - FHWA-RD-77-108. Traffic noise levels were calculated 70 feet from the centerline of the analyzed roadway. The modeling is theoretical and does not take into account any existing barriers, structures, and/or topographical features that may further reduce noise levels. Therefore, the levels are shown for comparative purposes only to show the difference between with and without project conditions. In addition, the noise contours for 55, 60, 65, and 70 dBA CNEL were calculated. The potential off-site noise impacts caused by an increase of traffic from operation of the proposed Project on the nearby roadways were calculated for existing, existing plus Project, cumulative 2046, and cumulative 2046 plus project scenarios.

Table 3 and 4 compare the without and with project scenario and shows the change in traffic noise levels as a result of the proposed Project. It takes a change of 3 dB or more to hear a perceptible difference.

Table 3: Existing Scenario - Noise Levels Along Roadways (dBA CNEL)

Roadway	Segment	Existing	Existing With Project	
		CNEL @ 50' dBA	CNEL @ 50' dBA	Change in Noise Level
Behymer Avenue	Willow Avenue to Minnewawa Avenue	60.4	60.5	0.1
Behymer Avenue	Minnewawa Avenue to Sunnyside Avenue	62.5	62.5	0.0
Behymer Avenue	Sunnyside Avenue to Fowler Avenue	62.4	62.4	0.0
Shepherd Avenue	Willow Avenue to Minnewawa Avenue	67.7	68.2	0.5
Shepherd Avenue	Minnewawa Avenue to Clovis Avenue	67.3	68.2	0.9
Shepherd Avenue	Clovis Avenue to Sunnyside Avenue	66.6	68.2	1.6
Shepherd Avenue	Sunnyside Avenue to Project Driveway 3	65.1	66.8	1.7
Shepherd Avenue	Project Driveway 3 to Fowler Avenue	65.1	65.8	0.7
Herndon Avenue	State Route 168 Eastbound Ramps to Clovis Avenue	69.4	69.6	0.2
Willow Avenue	Behymer Avenue to Shepherd Avenue	72.4	72.5	0.1
Minnewawa Avenue	Behymer Avenue to Shepherd Avenue	63.5	63.5	0.0
Clovis Avenue	Shepherd Avenue to Teague Avenue	64.1	65.3	1.2
Clovis Avenue	Teague Avenue to Nees Avenue	66.3	66.9	0.6
Clovis Avenue	Nees Avenue to Alluvial Avenue	67.9	68.4	0.5
Clovis Avenue	Alluvial Avenue to Herndon Avenue	69.9	70.2	0.3
Sunnyside Avenue	Project Driveway 1 to Shepherd Avenue	54.4	60.5	6.1

Roadway	Segment	Existing	Existing With Project	
		CNEL @ 50' dBA	CNEL @ 50' dBA	Change in Noise Level
Sunnyside Avenue	Shepherd Avenue to Teague Avenue	60.3	61.6	1.3
Sunnyside Avenue	Teague Avenue to Nees Avenue	60.6	61.8	1.2
Fowler Avenue	Behymer Avenue to Ticonderoga	63.4	63.5	0.1
Fowler Avenue	Ticonderoga to Shepherd Avenue	64.4	64.4	0.0
Fowler Avenue	Shepherd Avenue to Teague Avenue	65.1	65.7	0.6
Fowler Avenue	Teague Avenue to Nees Avenue	65.1	65.7	0.6
Fowler Avenue	Nees Avenue to State Route 168 Westbound Ramps	69.9	70.1	0.2

Notes:
1. Traffic volumes compiled LSA Associates, Inc. Jan 2023.
2. An impact would occur if the Project increased the roadway segment level by 3 dB or more (an audible difference) and resulting in a future level from clearly compatible to normally compatible or from normally compatible to normally incompatible.

When comparing existing plus project levels to existing levels, Sunnyside Avenue from Project Driveway 1 to Shepherd Avenue has the potential for significant impact as the only roadway segment with an increase of more than 3 dB. The existing counts do not take into account the Project to the west of the project site, whose counts are included in the cumulative 2046 condition. As the existing land is considered vacant, there is no impact to the land use compatibility as a result of the Project. The potential impact to the future Project to the west will be considered in the 2046 condition.

Table 4: 2046 Scenario - Noise Levels Along Roadways (dBA CNEL)

Roadway	Segment	Existing	Existing With Project	
		CNEL @ 50' dBA	CNEL @ 50' dBA	Change in Noise Level
Behymer Avenue	Willow Avenue to Minnewawa Avenue	66.4	66.4	0.0
Behymer Avenue	Minnewawa Avenue to Sunnyside Avenue	67.0	67.0	0.0
Behymer Avenue	Sunnyside Avenue to Fowler Avenue	63.3	63.4	0.1
Shepherd Avenue	Willow Avenue to Minnewawa Avenue	71.9	72.1	0.2
Shepherd Avenue	Minnewawa Avenue to Clovis Avenue	71.2	71.6	0.4
Shepherd Avenue	Clovis Avenue to Sunnyside Avenue	70.8	71.5	0.7
Shepherd Avenue	Sunnyside Avenue to Project Driveway 3	69.0	69.8	0.8
Shepherd Avenue	Project Driveway 3 to Fowler Avenue	69.0	69.3	0.3
Herndon Avenue	State Route 168 Eastbound Ramps to Clovis Avenue	70.5	70.6	0.1
Willow Avenue	Behymer Avenue to Shepherd Avenue	76.3	76.3	0.1
Minnewawa Avenue	Behymer Avenue to Shepherd Avenue	68.6	68.6	0.0
Clovis Avenue	Shepherd Avenue to Teague Avenue	69.9	70.2	0.3
Clovis Avenue	Teague Avenue to Nees Avenue	69.9	70.2	0.3
Clovis Avenue	Nees Avenue to Alluvial Avenue	70.9	71.1	0.3
Clovis Avenue	Alluvial Avenue to Herndon Avenue	71.8	72.1	0.2
Sunnyside Avenue	Project Driveway 1 to Shepherd Avenue	68.7	69.2	0.5
Sunnyside Avenue	Shepherd Avenue to Teague Avenue	64.1	64.7	0.6

Roadway	Segment	Existing	Existing With Project	
		CNEL @ 50' dBA	CNEL @ 50' dBA	Change in Noise Level
Sunnyside Avenue	Teague Avenue to Nees Avenue	63.9	64.5	0.6
Fowler Avenue	Behymer Avenue to Ticonderoga	64.3	64.3	0.0
Fowler Avenue	Ticonderoga to Shepherd Avenue	67.9	67.9	0.0
Fowler Avenue	Shepherd Avenue to Teague Avenue	68.4	68.7	0.3
Fowler Avenue	Teague Avenue to Nees Avenue	67.9	68.2	0.3
Fowler Avenue	Nees Avenue to State Route 168 Westbound Ramps	71.4	71.6	0.1

Notes:
1. Traffic volumes compiled LSA Associates, Inc. Jan 2023.
2. An impact would occur if the Project increased the roadway segment level by 3 dB or more (an audible difference) and resulting in a future level from clearly compatible to normally compatible or from normally compatible to normally incompatible.

The Cumulative 2046 scenario has a maximum change in noise level of 0.7 dBA CNEL. Sunnyside Avenue from Project Driveway 1 to Shepherd Avenue has a 0.5 dBA CNEL change. Future residential uses will be in the normally compatible level along that segment.

7.1.2 Noise Impacts to On-Site Receptors Due to Project Generated Traffic

The Project's proposed residential properties are outside of Shepherd Avenue's and Sunnyside Avenue's 70 dBA CNEL contours. Residences along the first row of Sunnyside will experience levels up to 69.9 dBA CNEL at the property line. Residences along Shepherd Avenue will be exposed to levels up to 69.1 dBA CNEL at the property line. These are within the normally compatible levels for residential uses but above the exterior 65 dBA CNEL standard as outlined in Table ES-1 of the 2014 General Plan.

To meet the exterior residential standards, the unshielded residential private yards within 100 ft of the centerline of Shepherd Avenue and Sunnyside Avenue must be shielded by 6-foot sound walls. These walls must be at least 4.2 lbs/ft^2. Any unshielded residential glass facades within 100 ft of the centerline of Shepherd Avenue or Sunnyside Avenue directly facing the subject roadway must have an STC rating of 30 or more. This includes any 2nd-floor windows which would not be shielded by the 6-foot sound walls.

8.0 Construction Noise Impact

The degree of construction noise may vary for different areas of the project site and also vary depending on the construction activities. Noise levels associated with the construction will vary with the different phases of construction.

8.1 Construction Noise

The Environmental Protection Agency (EPA) has compiled data regarding the noise generated characteristics of typical construction activities. The data is presented in Table 5.

Table 5: Typical Construction Equipment Noise Levels[1]

Type	Lmax (dBA) at 50 Feet
Backhoe	80
Truck	88
Concrete Mixer	85
Pneumatic Tool	85
Pump	76
Saw, Electric	76
Air Compressor	81
Generator	81
Paver	89
Roller	74

Notes:
[1] Referenced Noise Levels from FTA noise and vibration manual.

Construction noise is considered a short-term impact and would be considered significant if construction activities are taken outside the allowable times as described in the City of Clovis Municipal Code Section 5.27.604. Construction is anticipated to occur during the permissible hours according to the County's Municipal Code. Construction noise will have a temporary or periodic increase in the ambient noise level above the existing within the project vicinity. Furthermore, noise reduction policies are provided to further reduce construction noise. The impact is considered less than significant. However, construction noise level projections are provided.

Typical operating cycles for these types of construction equipment may involve one or two minutes of full-power operation followed by three to four minutes at lower power settings. Noise levels will be the loudest during the grading phase. The modeling assumes construction equipment as close as 25 feet from the adjacent residences and an average of 550 feet away from the adjacent residences.

Unmitigated noise levels at 550 feet have the potential to reach 60 dBA L_{eq} and 92 dBA L_{max} at the nearest sensitive receptors during grading. Noise levels for the other construction phases would be lower, approximately from 46 to 59 dBA L_{eq} and 86 to 93 dBA L_{max}. This would be a 13 dB Leq daytime increase in the ambient noise level at the residents along Perrin Rd., Purdue Ave., and Lexington.

8.2 Construction Vibration

Construction activities can produce vibration that may be felt by adjacent land uses. The construction of the proposed Project would not require the use of equipment such as pile drivers, which are known to generate substantial construction vibration levels. The primary vibration source during construction may be from a bulldozer. A large bulldozer has a vibration impact of 0.089 inches per second peak particle velocity (PPV) at 25 feet which is perceptible but below any risk to architectural damage.

The fundamental equation used to calculate vibration propagation through average soil conditions and distance is as follows:

$$PPV_{equipment} = PPV_{ref}\ (100/D_{rec})^{n}$$

Where: PPV_{ref} *= reference PPV at 100ft.*
D_{rec} *= distance from equipment to receiver in ft.*
$n = 1.1$ *(the value related to the attenuation rate through ground)*

The thresholds from the Caltrans Transportation and Construction Induced Vibration Guidance Manual in Table 6 (below) provides general thresholds and guidelines as to the vibration damage potential from vibratory impacts.

Table 6: Guideline Vibration Damage Potential Threshold Criteria

Structure and Condition	Maximum PPV (in/sec)	
	Transient Sources	Continuous/Frequent Intermittent Sources
Extremely fragile historic buildings, ruins, ancient monuments	0.12	0.08
Fragile buildings	0.2	0.1
Historic and some old buildings	0.5	0.25
Older residential structures	0.5	0.3
New residential structures	1.0	0.5
Modern industrial/commercial buildings	2.0	0.5

Source: Table 19, Transportation and Construction Vibration Guidance Manual, Caltrans, Sept. 2013.
Note: Transient sources create a single isolated vibration event, such as blasting or drop balls. Continuous/frequent intermittent sources include impact pile drivers, pogo-stick compactors, crack-and-seat equipment, vibratory pile drivers, and vibratory compaction equipment.

Table 7 gives approximate vibration levels for particular construction activities. This data provides a reasonable estimate for a wide range of soil conditions.

Table 7: Vibration Source Levels for Construction Equipment[1]

Equipment	Peak Particle Velocity (inches/second) at 25 feet	Approximate Vibration Level LV (dVB) at 25 feet
Pile driver (impact)	1.518 (upper range)	112
	0.644 (typical)	104
Pile driver (sonic)	0.734 upper range	105
	0.170 typical	93
Clam shovel drop (slurry wall)	0.202	94
Hydromill	0.008 in soil	66
(slurry wall)	0.017 in rock	75
Vibratory Roller	0.21	94
Hoe Ram	0.089	87
Large bulldozer	0.089	87
Caisson drill	0.089	87
Loaded trucks	0.076	86
Jackhammer	0.035	79
Small bulldozer	0.003	58

[1] Source: Transit Noise and Vibration Impact Assessment, Federal Transit Administration, May 2006.

At a distance of 25 feet, a large bulldozer would yield a worst-case 0.089 PPV (in/sec) which means the vibration would be perceptible when close to the adjacent residential properties but is below any threshold of damage. Construction vibration is exempt from the vibration standards per 9.22.100(D) of the municipal code, so there is therefore no impact, and no mitigation is required.

8.3 Construction Noise Reduction Policies

Construction operations must follow the County's General Plan and the Noise Ordinance, which states that construction, repair or excavation work performed must occur within the permissible hours. To further ensure that construction activities do not disrupt the adjacent land uses, the following policies shall be taken:

1. Construction shall occur during the permissible hours as defined in Section 5.27.604.
2. During construction, the contractor shall ensure all construction equipment is equipped with appropriate noise attenuating devices.
3. The contractor shall locate equipment staging areas that will create the greatest distance between construction-related noise/vibration sources and sensitive receptors nearest the project site during all project construction.
4. Idling equipment shall be turned off when not in use.
5. Equipment shall be maintained so that vehicles and their loads are secured from rattling and banging.

1.0 INTRODUCTION

This Transportation Impact Analysis (TIA) has been prepared to assess the potential circulation impacts associated with the proposed Shepherd North Project (project) in Clovis, Fresno County, California. The approximately 155-acre project site is located at the northeast corner of the intersection of Sunnyside Avenue and Shepherd Avenue. The project site is currently vacant. Figure 1-1 illustrates the regional and project location. (Figures and tables are provided at the end of each chapter.)

This report has been prepared based on the City of Clovis (City) *Transportation Impact Analysis Guidelines* (TIA Guidelines), adopted October 17, 2022, as well as the requirements established by the City of Fresno and the California Department of Transportation (Caltrans).

While level of service (LOS) analysis is no longer a determinant of California Environmental Quality Act (CEQA) impacts, consistency with the City's General Plan goals and policies is still required. Therefore, this TIA includes a Vehicle Miles Traveled (VMT) Analysis for a CEQA Transportation Impact evaluation, and a Local Transportation Analysis (LTA) to satisfy the City's General Plan transportation goals and policies. The scope of work for this TIA, including scope for the CEQA VMT Analysis and LTA with trip generation, trip distribution, study area, and analysis methodologies, has been approved by City staff as well as the City of Fresno, County of Fresno, and Caltrans via the Scoping Agreement process. A copy of the Scoping Agreement is included as Appendix A.

1.1 PROJECT DESCRIPTION

The proposed project will consist of 605 single-family homes on approximately 77 acres of the site. It should be noted that the remaining 78 acres of the site will be used for roads, utilities, greenspace, landscaping, and pedestrian paths. For purposes of this TIA, the entire buildout condition of this project has been considered under all 'plus project' conditions. It is anticipated that the project buildout will occur in year 2028. Figure 1-2 illustrates the tentative subdivision map for the project.

As illustrated in Figure 1-2, access to the project will be provided by four driveways: two on Sunnyside Avenue, one on Perrin Road, and one on Shepherd Avenue. Except for the driveway on Shepherd Avenue, all other project driveways will operate as full-access driveways. The driveway on Shepherd Avenue will operate as a Right-In Right-Out/Left-In (RIRO/LI) driveway.

Additionally, the project proposes to add one westbound through lane along the project frontage on Shepherd Avenue, and a dedicated eastbound left-turn lane at the project driveway on Shepherd Avenue.

1.2 CEQA VEHICLE MILES TRAVELED ANALYSIS

As per the City's TIA Guidelines, the project cannot be considered small because it exceeds 53 dwelling units (City's threshold for screening out single-family home projects from a VMT analysis). Therefore, a detailed VMT analysis has been conducted for the project. For purposes of this analysis, the project-generated VMT per capita has been obtained from the Fresno Council of Governments (Fresno COG) Activity Based Model (ABM). As per the City's TIA Guidelines, a significant project-generated VMT impact would occur if the project's VMT per capita exceeds a level of 13 percent below the existing County average VMT per capita provided in the guidelines. The detailed VMT analysis, including the screening criteria evaluation, VMT analysis methodology, results, and appropriate mitigation measures for the proposed project are discussed in Chapter 2.0.

1.3 LOCAL TRANSPORTATION ANALYSIS STUDY AREA

The LTA for the project examines traffic operations in the vicinity of the proposed project under the following five scenarios:

- Existing Conditions
- Existing Plus Project Conditions
- Near-Term Plus Project Conditions
- Cumulative without Project Conditions
- Cumulative Plus Project Conditions

Traffic conditions at study intersections and roadway segments were examined for weekday a.m. and p.m. peak-hour conditions. The a.m. peak hour is defined as the 1 hour of highest traffic volumes occurring between 7:00 a.m. and 9:00 a.m. The p.m. peak hour is the 1 hour of highest traffic volumes occurring between 4:00 p.m. and 6:00 p.m. Additionally, since the project is estimated to be completed in 2028, the Near-Term condition was evaluated for the year 2028.

As per the City's TIA Guidelines, the extent of the study area should include the following:

- Pedestrian, bicycle, and transit facilities within 0.5 mile from the project site boundary

- All intersections of major streets that would provide direct access to the project

- All signalized intersections within 0.5 mile of the project site boundary where the project would add 50 or more peak-hour trips, and signalized intersections beyond 0.5 mile where the project would add 100 or more peak-hour trips

- All unsignalized intersections within a 0.5 mile of the project site boundary where the project would add more than 50 peak-hour trips

Based on the aforementioned criteria and as per discussion with the City and adjacent jurisdictions during the scoping agreement process, the following intersections and roadway segments have been included in the LTA.

1.3.1 Study Intersections

Per the Scoping Agreement (Appendix A), intersections analyzed in the LTA and their jurisdictions are as follows:

1. Willow Avenue/Behymer Avenue (Clovis/Fresno)
2. Willow Avenue/Shepherd Avenue (Clovis/ Fresno)
3. Minnewawa Avenue/Behymer Avenue (Clovis)

4. Minnewawa Avenue/Shepherd Avenue (Clovis)
5. Clovis Avenue/Shepherd Avenue (Clovis)
6. Clovis Avenue/Teague Avenue (Clovis)
7. Clovis Avenue/Nees Avenue (Clovis)
8. Clovis Avenue/Alluvial Avenue (Clovis)
9. State Route 168 (SR-168) Westbound Ramps/Herndon Avenue (Caltrans)
10. SR-168 Eastbound Ramps/Herndon Avenue (Caltrans)
11. Clovis Avenue/Herndon Avenue (Clovis)
12. Sunnyside Avenue/Behymer Avenue (Clovis)
13. Sunnyside Avenue/Shepherd Avenue (Clovis)
14. Sunnyside Avenue/Teague Avenue (Clovis)
15. Sunnyside Avenue/Nees Avenue (Clovis)
16. Fowler Avenue/Behymer Avenue (Clovis)
17. Fowler Avenue/Ticonderoga (Clovis)
18. Fowler Avenue/Shepherd Avenue (Clovis)
19. Fowler Avenue/Teague Avenue (Clovis)
20. Fowler Avenue/Nees Avenue (Clovis)
21. Fowler Avenue/SR-168 Westbound Ramps (Caltrans)
22. Fowler Avenue/SR-168 Eastbound Ramps (Caltrans)
23. Sunnyside Avenue/Project Driveway 1 (Clovis)
24. Sunnyside Avenue/Project Driveway 2 (Clovis)
25. Project Driveway 3/Shepherd Avenue (Clovis)
26. Project Driveway 4-Stanford Avenue/Perrin Road (Clovis)

Figure 1-3 illustrates the study area intersections.

1.3.2 Roadway Segments

Per the Scoping Agreement (Appendix A), roadway segments analyzed in the LTA are as follows:

1. Behymer Avenue, between Willow Avenue and Minnewawa Avenue (Clovis)
2. Behymer Avenue, between Minnewawa Avenue and Sunnyside Avenue (Clovis)
3. Behymer Avenue, between Sunnyside Avenue and Fowler Avenue (Clovis)
4. Shepherd Avenue, between Willow Avenue and Minnewawa Avenue (Clovis)
5. Shepherd Avenue, between Minnewawa Avenue and Clovis Avenue (Clovis)
6. Shepherd Avenue, between Clovis Avenue and Sunnyside Avenue (Clovis)
7. Shepherd Avenue, between Sunnyside Avenue and Project Driveway 3 (Clovis)
8. Shepherd Avenue, between Project Driveway 3 and Fowler Avenue (Clovis)
9. Herndon Avenue, between State Route 168 Eastbound Ramps and Clovis Avenue (Clovis)
10. Willow Avenue, between Behymer Avenue and Shepherd Avenue (Clovis/Fresno)
11. Minnewawa Avenue, between Behymer Avenue and Shepherd Avenue (Clovis)
12. Clovis Avenue, between Shepherd Avenue and Teague Avenue (Clovis)
13. Clovis Avenue, between Teague Avenue and Nees Avenue (Clovis)
14. Clovis Avenue, between Nees Avenue and Alluvial Avenue (Clovis)
15. Clovis Avenue, between Alluvial Avenue and Herndon Avenue (Clovis)
16. Sunnyside Avenue, between Project Driveway 1 and Shepherd Avenue (Clovis)

17. Sunnyside Avenue, between Shepherd Avenue and Teague Avenue (Clovis)
18. Sunnyside Avenue, between Teague Avenue and Nees Avenue (Clovis)
19. Fowler Avenue, between Behymer Avenue and Ticonderoga (Clovis)
20. Fowler Avenue, between Ticonderoga and Shepherd Avenue (Clovis)
21. Fowler Avenue, between Shepherd Avenue and Teague Avenue (Clovis)
22. Fowler Avenue, between Teague Avenue and Nees Avenue (Clovis)
23. Fowler Avenue, between Nees Avenue and State Route 168 Westbound Ramps (Clovis)

For each roadway segment, the highest volume on any part of the segment has been considered as the analysis volume for the entire segment.

2.0 VEHICLE MILES TRAVELED ANALYSIS

On December 28, 2018, the California Office of Administrative Law cleared the revised CEQA Guidelines for use. Among the changes to the CEQA Guidelines was the removal of vehicle delay and LOS from consideration under CEQA. With the adopted CEQA Guidelines, transportation impacts are to be evaluated based on a project's effect on VMT.

The City's TIA Guidelines includes screening criteria, VMT analysis methodology, VMT impact thresholds, and VMT mitigation measures. Therefore, the City's TIA Guidelines were used in the evaluation of the project's VMT analysis.

2.1 METHODOLOGY

The TIA Guidelines provide multiple project types and thresholds for land use projects. The project was compared with the screening criteria established in the "Project Screening" section of the TIA Guidelines to check if the project can be screened out. The following is a brief description of the project in relation with the project screening criteria:

- **Small Project:** The TIA Guidelines states that projects generating less than 500 daily trips could be screened out of a detailed VMT analysis. As discussed in Section 6.1, Project Trip Generation, the project is estimated to generate 5,705 daily trips. Therefore, the project does not satisfy this screening criteria.

- **Provision of Affordable Housing:** The project proposes to develop market-rate, single-family dwelling units. Therefore, this screening criteria does not apply to the project.

- **Local-Serving Retail:** The project consists of residential land use only; therefore, this screening criteria does not apply to the project.

- **Project Located in a High-Quality Transit Area (HQTA):** The project is not located within an HQTA; therefore, this screening criteria does not apply to the project.

- **Project Located in Low VMT Area:** The project is not located in a low VMT area; therefore, this criteria does not apply to the project.

As shown above, the project could not be screened out from a detailed VMT analysis. As such, pursuant to the TIA Guidelines, a detailed VMT analysis was conducted to assess the project's VMT impact.

2.1.1 Thresholds of Significance

The project consists of residential land use. The TIA Guidelines established VMT per capita as the appropriate metric to evaluate residential land use projects while defining Fresno County as the "region" for determining VMT thresholds. The project would have a significant VMT impact if the baseline project VMT per capita is greater than 87 percent of the baseline Fresno County VMT per capita. Based on the TIA Guidelines, baseline Fresno County VMT per capita is 16.1 and the corresponding threshold is 14.1 (which is 87 percent of 16.1). Therefore, the project will have a significant VMT impact if the project VMT per capita is greater than 14.1.

As recommended in the TIA Guidelines, the Fresno COG ABM was used for the project VMT analysis. The model inputs were updated with the project land uses to calculate project VMT. The project VMT was calculated from a Fresno COG ABM model run as described in the following sections.

2.1.2 Project Traffic Analysis Zone Update

The first step in preparation of this analysis was to update the traffic analysis zones (TAZs) in the model that include the project area. The Fresno COG ABM includes the ability to add or split zones. In order to isolate the project VMT, a new zone was created in the model. The project households were included in the newly created zone for modeling purposes. No project-specific network modifications were required for the model run. A model run was conducted for the existing/base scenario with updated model inputs. The outputs from this updated model run were used to calculate the project VMT per capita.

2.1.3 Model Runs and Project Vehicle Miles Traveled Estimation

A model run was conducted for this updated model upon completion of the socioeconomic data update. The outputs from this updated model run were used to calculate the project VMT per capita.

2.2 PROJECT VEHICLE MILES TRAVELED ANALYSIS

Table 2-A summarizes the regional threshold and project VMT per capita. As shown in Table 2-A, the project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Therefore, based on the TIA Guidelines, the project will have a significant VMT impact.

Detailed VMT calculation for the project is included in Appendix B.

2.3 VMT REDUCTION MEASURES – PROJECT DESIGN FEATURES AND MITIGATION MEASURES

When a lead agency identifies a significant CEQA impact, the agency must identify feasible mitigation measures in order to avoid or substantially reduce that impact. VMT impacts can be mitigated through more behavioral changes. Enforcement of mitigation measures will be subject to the mitigation monitoring requirements under CEQA, as well as the regular police powers of the agency. These measures can also be incorporated as a part of plans, policies, regulations, or project designs. Project design features that encourage mode shift from automobiles to transit or non-motorized modes can therefore help reduce project VMT as well. Typically, VMT reduction and benefits from these project design features are not accounted in the project VMT calculations conducted using the regional travel demand model (Fresno COG ABM). Therefore, VMT reduction credit can be accounted for these design features similar to VMT mitigation measures to help reduce the project's VMT impact.

Evaluation of VMT reductions should be evaluated using state-of-the-practice methodologies recognizing that many of the VMT mitigation strategies/project design features are dependent on building tenant performance over time. Following is a detailed description of both and the corresponding potential reduction that could be achieved with implementation of these measures.

2.3.1 Project Design Features

As per information provided by the applicant, the project intends to implement the following project design features that will help reduce project VMT. VMT reduction that can be achieved by the project design features have been estimated using the most California Air Pollution Control Officers Association's (CAPCOA) "*Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity – Designed for Local Governments, Communities, and Project Developers*" dated December 2021.

- **Pedestrian Infrastructure:** The project proposes to provide pedestrian improvements/sidewalks both internal to the project site and along the project frontage. Providing sidewalk/pedestrian improvements encourage people to walk instead of drive and thus reduces VMT. CAPCOA transportation measure **T-18: Provide Pedestrian Network Improvement** was used to estimate the VMT reduction due to project related enhancements in pedestrian access and connectivity. The CAPCOA methodology requires existing sidewalk length in the project study area in addition to the length of sidewalk being provided by the project. In order to estimate the existing sidewalk length, a survey was conducted along the proposed project frontage. Based on the survey, the project study area includes approximately 10 miles of sidewalk. The project proposes to add approximately another 2.3 miles of sidewalk/pedestrian access. Therefore, this mitigation measure may reduce the project's VMT by approximately 1.17 percent.

- **Improve Street Connectivity:** The project proposes to provide an internal circulation network. Projects with higher density of intersections would help increase street connectivity, reduce trip lengths, and promote use of alternative transportation modes of travel. CAPCOA handbook, identifies measure **T-17: Improve Street Connectivity** to evaluate project street network. The measure is recommended as an appropriate design feature for plans within urban or suburban areas. The project is located in suburban/rural area type setting, so this measure was explored as a potential VMT reduction design feature.

  Measure T-17 estimates that an increased density of vehicular intersections improves street connectivity and helps in reduction in GHG emissions and corresponding VMT. As included in the CAPCOA handbook, this measure could be applied to a project for:

  > *'Projects that increase intersection density would be building a new street network in a subdivision or retrofitting an existing street network to improve connectivity (e.g., converting cul-de-sacs or dead-end streets to grid streets)'.*

  The measure establishes the following numerical formula of VMT reduction due to increased intersection density and improved street connectivity:

$$A = \frac{B - C}{C} * D$$

Where,

A = Percent Reduction in GHG/VMT emission from vehicle Travel

B = Intersection Density in project site with measure

C = Average Intersection Density for Typical developments (36)

D = Elasticity of VMT with respect to intersection density (-0.14)

The CAPCOA handbook establishes the variable C using an average density of intersections within a square mile in a typical development as included in the *Proposed Trip Generation, Distribution, and Transit Mode Split Forecasts for the Bayview Waterfront Project Transportation Study*, Fehr & Peers. 2009. This establishes the average suburban intersection density for the entire United States.

The CAPCOA handbook adapts the variable D, Elasticity of VMT with respect to intersection density from the report '*Does Compact Development Make People Drive Less*?' published in the *Journal of the American Planning Association*, 2016, authored by Mark R. Stevens. The elasticity was determined from a meta-regression analysis from data of fifteen studies, having studied in different urban/suburban geographic regions within the Country.

While the increased intersection density helps facilitate greater number of short trips, the project consists of only single land use type (residential) and the amount of internal capture (trips that can be fulfilled within the project; with both origin and destinations within the project site) would be minimal. Also, CAPCOA suggests application of different VMT mitigation measures at different scales – project/site scale or community/plan scale. Based on CAPCOA handbook, this mitigation measure is applicable at a plan/community scale. However, this measure was explored as a VMT reduction design feature at a project scale with appropriate limitations as described below.

While all the internal intersections can be considered to estimate the VMT reduction due to increased street connectivity, given the above limitations (project location area type, single land use type, and CAPCOA applicability scale), only project driveways were reviewed for applicability for this measure. As indicated in section "1.1 – Project Description", the project has four driveways (two on Sunnyside Avenue, one of Perrin Road, and one on Shepherd Avenue) for project access. Except for the driveway on Shepherd Avenue, all other project driveways will operate as full-access driveways. The driveway on Shepherd Avenue will operate as a Right-In Right-Out Left-In (RIROLI) driveway. However, all 4 project driveways were considered as project intersections for the mitigation purposes. The proposed project site is approximately 77 acres. Therefore, the intersection density of the project would be approximately 33.25 intersections per square mile.

Since project intersection density is lower than the countrywide average intersection density of 36 intersections per square mile as identified in the CAPCOA handbook, no direct VMT reduction has been accounted for this project design feature.

- **Bicycle Infrastructure/Improvements:** The project proposes to provide 8-feet wide bike lanes (Class II Bike Lane) on Shepherd Avenue and N. Sunnyside Avenue. Additionally, the project will install a 12-foot trail (Class I Bike Path) adjacent to the Project along Shepherd Avenue. The project proposes to construct a total of 0.67 miles of bike lanes along Shepherd Avenue and Sunnyside Avenue. Similar to pedestrian facilities, these bicycle design features included in the project can encourage increase active transportation mode share in the area. The CAPCOA manual was utilized to estimate the reduction of project VMT due to proposed bicycle improvements. Specifically, CAPCOA transportation measure "T-19A: Construct or Improve Bike Facility" was deemed applicable to estimate the VMT reduction due to project bicycle features. According to the measure, providing bicycle infrastructure helps to improve biking conditions within an area. This encourages a mode shift on the roadway parallel to the bicycle facility from vehicles to bicycles, displacing VMT and thus reducing GHG emissions. Based on CAPCOA estimates, the project bicycle design features have a potential to reduce up to 0.01 percent of the project VMT.

- **Provide Electric Vehicle (EV) Parking and EV Charging Infrastructure:** Accessible EV parking and provision of charging for electric vehicles in the residential units will encourage the use of EVs. The latest California Green Building Standards (CALGreen), California Building Code, requires provision of infrastructure to accommodate electric vehicle chargers for new single family and attached dwelling units/town houses. For new construction projects such as apartments, condos, hotels, and motels, CALGreen code requires the project to provide EV charging stations as a percentage of the total project parking. While it is understood that provision of electric charging infrastructure/stations might not reduce VMT, it will reduce GHG which can be considered equivalent to reduction in VMT. According to CAPCOA, provision of additional electric charging stations, in addition to CALGreen requirements, can be considered as a GHG/VMT mitigation. Provision of EV charging infrastructure has a potential to achieve a maximum VMT reduction of up to 11.9 percent. However, the project is a single-family residential development and as such doesn't propose to provide electric charging stations beyond the CALGreen code requirements. Additionally, there is no guarantee that residents would be using electric vehicles even if charging stations are available. As such, while this project design feature has the potential to reduce GHG emissions, no direct VMT reduction has been accounted for this project design feature.

Table 2-B provides methodology, assumptions, and parameters used in the estimation/calculation of VMT reduction for the project along with the potential amount of VMT reduction that can be achieved.

In conclusion, project design features aim to promote overall mobility with the goal of reducing VMT and reducing greenhouse gas emissions. Implementation of the above project design features may possibly reduce the project's VMT by approximately up to 1.18 percent. The proposed measures and strategies should be monitored for their usage and effectiveness. A combination of measures from several VMT reduction strategies were incorporated into the Project design to achieve this VMT reduction as outlined above. This included strategies that are aimed at reducing the number of automobile trips generated by the Project, shift more trips from automobile to non-automobile modes, and/or reduce the distances that people drive. Ultimately, however, the City of Clovis is a suburban community with land use characteristics that are more spread out when compared to dense urban communities. The land use and transportation characteristics of suburban communities such as Clovis, can make it difficult, or impossible to achieve VMT reductions to levels that the City has established as a goal, and ultimately, as a threshold of significance for CEQA analysis. The project design features are estimated to offset some of the VMT impacts of the project by reducing VMT by up to 1.18 percent, but this reduction will not reduce the impact to a less than significant level. Therefore, the project will have a significant and unavoidable transportation impact under CEQA.

2.4 LIST OF CHAPTER 2.0 TABLES

Table 2-A: Existing (2019) Regional and Project VMT per Capita

Region (Fresno County)[1]	Project	Difference	Percentage Difference
14.1	17.0	2.9	20.7%

Source: Fresno Council of Governments' Activity-Based Model.

[1] The Fresno County VMT per capita was obtained from the Interim Transportation Impact Guidelines, City of Clovis (July 14, 2020).

VMT = vehicle miles traveled

Table 2-B: Calculated VMT Reduction with Project Mitigation

Mitigation Measure (Number corresponds to the 2021 CAPCOA Handbook)	Formula	Comments	Calculated Reduction in VMT (%)
Land Use (Maximum Reduction 30%)			
T-17: Improve Street Connectivity	A = ((B-C)/C) * D, Where B = Intersection density in project site with measure, C =Average intersection density (36 U.S. average), and D = Elasticity of VMT with respect to intersection density (-0.14 constant)	Based on the limitations described in detail above, four project driveways were considered to estimate the project intersection density. The project site is approximately 77 acres. Therefore, the intersection density of the project would be approximately 33.25 intersections per square mile which is less than countrywide average intersection density of 36 intersections per square mile. Therefore, no VMT mitigation was estimated for this measure.	N/A
Neighborhood Design (Maximum Reduction 10%)			
T-18: Provide Pedestrian Network Improvement	A = ((C/B)-1) * D, Where B = Existing sidewalk length in study area, C =Sidewalk length in study area with measure, and D = Elasticity of household VMT with respect to the ratio of sidewalks-to-streets (-0.05 constant)	Based on the survey, the project study area includes approximately 10 miles of sidewalk. The project proposes to add approximately another 2.3 miles of sidewalk/pedestrian access. A = (((10.25+2.39)/10.25)-1)*0.05 A = ((12.64/10.25)-1)*0.05 A = 0.23*0.05 = 1.17%	1.17%
T-19-A: Construct or Improve Bike Facility	A = (B*(F/I)*(C+D)*E*G)/H, Where B = Percent of plan/community VMT on parallel roadway, C = Active transportation adjustment factor, D = Credits for key destinations near project, E = Growth factor adjustment for facility type, F = Annual days of use of new facility, G = Existing regional average one-way bicycle trip length, H = Existing regional average one-way vehicle trip length, and I = Days per year (365)	Variables C, D, E, F, G, and H were obtained from appropriate tables listed in CAPCOA handbook. It was assumed that 20% of VMT on the parallel roadway is from the community. A = (0.2*(320/365)*(0.0029+0.0005)*1*2.2)/11.7 A = (0.2*0.88*0.0034*1*2.2)/11.7 A = 0.01%	0.01%
Total VMT Reduction from All Subsectors			**1.18%**

Source: Handbook for Analyzing Greenhouse Gas Emission Reduction, Assessing Climate Vulnerabilities, and Advancing Health and Equity, California Air Pollution Control Officers Association (CAPCOA), December 2021.

[1] Per CAPCOA total VMT reduction for multiple strategies within same subsector is calculated using the equation: 1-(1-A)*(1-B)*(1-C)... where A, B, C are equal to individual mitigation strategy reduction percentages.
When applied to the project, the calculation would be 1 - (1 – 0.0117)* (1 – 0.0001) = 0.0118, or 1.18%.

3.0 LOCAL TRANSPORTATION ANALYSIS METHODOLOGY

3.1 LEVEL OF SERVICE DEFINITIONS

A complete description of the meaning of LOS can be found in Transportation Research Board Special Report 209, *Highway Capacity Manual* (HCM). The HCM establishes LOS A through F for intersections. A description of LOS for signalized and unsignalized intersections is summarized in Table 3-A. A description of LOS for roadway segments is summarized in Table 3-B.

Table 3-C shows the LOS criteria for unsignalized and signalized intersections. For all study area intersections, the *Highway Capacity Manual 6th Edition* (HCM 6) analysis methodologies were used to determine intersection LOS. Intersection LOS was calculated using the Synchro 11 software, which uses the HCM 6 methodologies.

Peak-hour traffic operations were analyzed at roadway segments based on the peak-hour LOS thresholds obtained from Chapter 5.16, *Transportation and Traffic,* of the City's *General Plan and Development Code Update Draft Program Environmental Impact Report (EIR),* dated June 2014. Table 3-D summarizes the LOS criteria used to evaluate roadway segments based on the City's General Plan EIR. The peak-hour traffic volumes at roadway segments represent the total vehicles (both directions) traveling on the segments during the a.m. and p.m. peak hours.

3.2 LEVEL OF SERVICE PROCEDURES AND STANDARDS

Study intersections and roadway segments analyzed in this report are completely under the jurisdiction of the City of Clovis or lie at the borders of Clovis and Fresno. However, intersections located at freeway on-ramps and off-ramps are under the jurisdiction of Caltrans.

The City of Clovis considers LOS D as the LOS standard for study intersections and roadway segments under near-term conditions, unless a finding of overriding consideration was adopted in the City's General Plan EIR. The same criterion holds for long-term conditions, except for roadway segments that are adopted in the City's General Plan EIR to operate at LOS E or F. The City's TIA Guidelines do not define an LOS standard under Existing Plus Project conditions. For the purpose of this analysis, an LOS standard of D has been considered for intersections and roadway segments under Existing Plus Project conditions. The City considers the following operational deficiency criteria for study intersections:

- **Signalized Intersections**
    - If the project triggers a signalized intersection operating at an acceptable LOS to operate at an unacceptable LOS; OR
    - If the project increases the average delay for average delay for a signalized intersection that is already operating at an unacceptable LOS.

- **Unsignalized Intersections**
  - If the project triggers an unsignalized intersection operating at acceptable LOS to operate at unacceptable LOS (from E or better to F) and meet the signal warrants criteria; OR
  - If the project increases the applicable delay for an unsignalized study intersection that is already operating at unacceptable LOS and meets the signal warrant criteria.

The City's TIA Guidelines do not define an operational deficiency criterion for roadway segments. For purposes of this analysis, at roadway segments under the jurisdiction of the City of Clovis, an operational deficiency has been considered when the project causes an unsatisfactory condition (deterioration from LOS A through D to E or F) or when the project contributes to an existing or forecast deficiency.

Per the City of Fresno *Traffic Impact Study Report Guidelines,* updated February 2009, LOS D is considered the LOS standard for study intersections and roadway segments under near-term conditions. The same criterion holds for long-term conditions, except for roadway segments that are adopted in the City's Master General Plan to operate at LOS E or F. The City's TIA Guidelines do not define an LOS standard under Existing Plus Project conditions.

It should be noted that all City of Fresno study intersections and roadway segments are located within the City of Fresno Traffic Impact Zone (TIZ) III. Per the City of Fresno's General Plan, all intersections and roadway segments within TIZ III should maintain a peak-hour LOS standard of D or better. Therefore, an LOS standard of D has been considered for intersections and roadway segments within Fresno for all analysis conditions. The City of Fresno considers the following operational deficiency criteria for study intersections:

- An operational deficiency is created if the addition of the project traffic results in any one of the following:
  - Causes the intersection LOS to change from acceptable to unacceptable levels; OR
  - Causes the intersection LOS to change from an unacceptable LOS (LOS E) to LOS F; OR
  - Increases the average delay at a study intersection that is already operating at an unacceptable LOS.

City of Fresno's Traffic Impact Study guidelines do not define an operational deficiency criterion for roadway segments. Therefore, for purposes of this analysis, at intersections under City of Fresno jurisdiction, an operational deficiency has been considered when the project causes an unsatisfactory condition (deterioration from LOS A through D to E or F) or when the project contributes to an existing or forecast deficiency.

Caltrans considers an acceptable LOS to be between LOS C and D at all intersections under its jurisdiction (delay of 45 seconds at signalized intersections). Caltrans does not have any operational deficiency criteria for study intersections. Therefore, an operational deficiency occurs when the project causes an unsatisfactory condition (deterioration from LOS A through D to E or F) for intersections or when the project contributes to an existing or forecast deficiency. The project needs to identify improvements to improve the intersection LOS to an acceptable level.

3.3 LIST OF CHAPTER 3.0 TABLES

Table 3-A: Intersection Level of Service Definitions

LOS	Description
A	Traffic operations with a control delay of 10 seconds per vehicle or less and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is exceptionally favorable or the cycle length is very short. If LOS A is the result of favorable progression, most vehicles arrive during the green indication and travel through the intersection without stopping.
B	Traffic operations with control delay between 10 seconds per vehicle and 20 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is low and either progression is highly favorable or the cycle length is short. More vehicles stop than with LOS A.
C	Traffic operations with control delay between 20 and 35 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when progression is favorable or the cycle length is moderate. Individual cycle failures (i.e., one or more queued vehicles are not able to depart as a result of the insufficient capacity during the cycle) may begin to appear at this level. The number of vehicles stopping is significant, although many vehicles still pass through the intersection without stopping.
D	Traffic operations with control delay between 35 and 55 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is high and either progression is ineffective or the cycle length is long. Many vehicles stop and individual cycle failures are noticeable.
E	Traffic operations with control delay between 55 and 80 seconds per vehicle and a volume-to-capacity ratio no greater than 1.0. This level is typically assigned when volume-to-capacity ratio is high, progression is unfavorable, and the cycle length is long. Individual cycle failures are frequent.
F	Traffic operations with control delay exceeding 80 seconds per vehicle or a volume-to-capacity ratio greater than 1.0. This level is typically assigned when the volume-to-capacity ratio is very high, progression is very poor, and the cycle length is long. Most cycles fail to clear the queue.

Source: Highway Capacity Manual (6th Edition).
LOS = level of service

Table 3-B: Roadway Segment Level of Service Definitions

LOS	Description
A	Describes primarily free-flow operation. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control Delay at the boundary intersection is minimal. The travel speed exceeds 80% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
B	Describes reasonably unimpeded operation. The ability to maneuver within the traffic stream is only slightly restricted, and control delay at the boundary is not significant. The travel speed is between 67% and 80% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
C	Describes stable operation. The ability to maneuver and change lanes at mid-segment locations may be more restricted than at LOS B. Longer queues at the boundary intersection may contribute to lower travel speeds. The travel speed is between 50% and 67% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
D	Indicates a less stable condition in which small increases in flow may cause substantial increases in delay and decreases in travel speed. This operation may be due to adverse signal progression, high volume, or inappropriate signal timing at the boundary intersections. The travel speed is between 40% and 50% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
E	Characterized by unstable operation and significant delay. Such operations may be due to some combination of adverse progression, high volume, and inappropriate signal timing at the boundary intersections. The travel speed is between 30% and 40% of the base free-flow speed, and the volume-to-capacity ratio is no greater than 1.0.
F	Characterized by flow at extremely low speed. Congestion is likely occurring at the boundary intersections, as indicated by high delay and extensive queuing. The travel speed is between 30% or less of the base free-flow speed, and the volume-to-capacity ratio is greater than 1.0.

4.0 CIRCULATION NETWORK SETTING

4.1 EXISTING CIRCULATION NETWORK

The project study area includes the following major roadways as classified based on the roadway classification provided in the Circulation Element of the City's General Plan. Figure 4-1 summarizes the classifications of major roadways within the study area. Following is a brief description of these roadways:

- **Willow Avenue:** Willow Avenue is designated as an Arterial in the City's General Plan. Between Behymer Avenue and Shepherd Avenue, Willow Avenue is a six-lane, divided Arterial with a raised median. There are bicycle lanes along both directions of this segment. However, there is no provision for on-street parking.

- **Minnewawa Avenue:** Within the study area, Minnewawa Avenue is designated as an Arterial in the City's General Plan. Between Behymer Avenue and Shepherd Avenue, Minnewawa Avenue is a two-lane, undivided Arterial. There are bicycle lanes along both directions of this segment. However, there is no provision for on-street parking.

- **Clovis Avenue:** Clovis Avenue is designated as an Arterial in the City's General Plan. Between Shepherd Avenue and Herndon Avenue, Clovis Avenue is mostly a four-lane, divided Arterial with a raised median or a two-way-left-turn lane (TWLTL) median. There are bicycle lanes along some portions of this segment. However, there is no provision for on-street parking.

- **Sunnyside Avenue:** Sunnyside Avenue is designated as a Collector in the City's General Plan. Between Perrin Road and Nees Avenue, Sunnyside Avenue is a two-lane, undivided Collector. There are no bicycle facilities along both directions of this segment. There is also no provision for on-street parking.

- **Fowler Avenue:** Fowler Avenue is designated as a Rural Collector between Behymer Avenue and Shepherd Avenue, and as an Arterial between Shepherd Avenue and the State Route 168 (SR-168) Westbound Ramps in the City's General Plan. Currently, between Behymer Avenue and Shepherd Avenue, Fowler Avenue is a two-lane undivided roadway with no designated bike lane or provision for on-street parking. Between Shepherd Avenue and Enterprise Canal, Fowler Avenue is a three-lane divided roadway, with two northbound lanes and one southbound lane. There is no provision for on-street parking but a dedicated bicycle lane exists in the southbound direction along this segment. Between Enterprise Canal and Teague Avenue, Fowler Avenue is a three-lane divided roadway, with one northbound lane and two southbound lanes. There is a dedicated southbound bike lane for most of the segment. Between Teague Avenue and Nees Avenue, it is a two-lane undivided road. There is no provision for on-street parking. Between Nees Avenue and Goshen Avenue, Fowler Avenue is a three-lane divided road with a raised median. There is a bicycle lane only along the northbound direction of this segment. There is no provision for on-street parking. Between Goshen Avenue and the SR-168 Westbound Ramps, Fowler Avenue is a four-lane divided road with a raised median. There are bicycle lanes along both directions of this segment. There is no provision for on-street parking.

- **Behymer Avenue:** Within the study area, Behymer Avenue is designated as an Arterial between Willow Avenue and Clovis Avenue, as a Collector between Clovis Avenue and Sunnyside Avenue, and as a Rural Collector between Sunnyside Avenue and Fowler Avenue in the City’s General Plan. Between Willow Avenue and Fowler Avenue, Behymer Avenue is a two-lane, undivided road. There are no bicycle facilities along both directions of this segment. There is also no provision for on-street parking.

- **Ticonderoga:** Ticonderoga is designated as a Local Street in the City’s General Plan. Within the study area, Ticonderoga is a two-lane, undivided Local Street. There are no bicycle facilities along both directions of this segment. There is also no provision for on-street parking.

- **Shepherd Avenue:** Within the study area, Shepherd Avenue is designated as an Arterial between Willow Avenue and Clovis Avenue, and as an Expressway between Clovis Avenue and Fowler Avenue in the City’s General Plan. Between Willow Avenue and Sunnyside Avenue, Shepherd Avenue is a three-lane, divided road with a raised median, while between Sunnyside Avenue and Fowler Avenue, it is a two-lane, partly undivided and partly divided road. There are bicycle lanes along both directions of the segment between Willow Avenue and Sunnyside Avenue. There are no bicycle facilities along any direction of the segment between Sunnyside Avenue and Fowler Avenue. There is no provision for on-street parking along any of these segments.

- **Teague Avenue:** Teague Avenue is designated as a Collector in the City’s General Plan. Between Sunnyside Avenue and Fowler Avenue, Teague Avenue is a two-lane, undivided Arterial. There are no bicycle facilities along both directions of this segment. There is also no provision for on-street parking.

- **Nees Avenue:** Within the study area, Nees Avenue is designated as an Arterial in the City’s General Plan. Between Clovis Avenue and Sunnyside Avenue, Nees Avenue is a mostly two-lane undivided road. There is a bicycle lane in the eastbound direction only along a small portion of this segment near the intersection with Sunnyside Avenue. However, there is no provision for on-street parking. Between Sunnyside Avenue and Fowler Avenue, Nees Avenue is a three-lane divided arterial with a raised median or a TWLTL median. There are bicycle lanes along some portions of this segment. However, there is no provision for on-street parking.

- **Alluvial Avenue:** Within the study area, Alluvial Avenue is designated as a Collector in the City’s General Plan. Between Clovis Avenue and Sunnyside Avenue, Alluvial Avenue is a two-lane, divided Collector with a TWLTL median. However, between Sunnyside Avenue and Fowler Avenue, Alluvial Avenue is a partly three-lane and partly four-lane undivided Collector. There are bicycle lanes along both directions of these segments. However, there is no provision for on-street parking.

- **Herndon Avenue:** Within the study area, Herndon Avenue is designated as an Arterial in the City’s General Plan. Between the SR-168 Eastbound Ramps and Clovis Avenue, Herndon Avenue is a 10-lane, divided Arterial with a raised median. There are no bicycle facilities along any direction of this segment. There is also no provision for on-street parking.

Figure 4-2 illustrates existing plus project study intersection geometrics and traffic control.

It is to be noted that the project will be widening Shepherd Avenue along its frontage from one lane to two lanes in the westbound direction. Therefore, Shepherd Avenue has been considered as a three-lane road under all ‘plus project’ scenarios in the TIA, with one lane in the eastbound direction and two lanes in the westbound direction. Figure 4-3 illustrates study intersection geometrics and traffic control under ‘plus project’ scenarios.

4.2 TRANSIT, BICYCLES, AND PEDESTRIANS

4.2.1 Transit Network

Clovis Transit Stageline Routes 10 and 80 operate within the study area. Route 10 operates from Monday through Saturday, while Route 80 operates only on school days, based on the Clovis Unified School District schedule. Route 10 provide access to Fresno State University and, and Route 80 provides access to Buchanan Education Complex.

Fresno Area Express (FAX) operates within the study area along Willow Avenue 7 days a week. The route connects communities in Fresno to the different campuses of Clovis Community College.

In addition to fixed route services, Round Up is the Clovis paratransit service for disabled City residents. Round Up transit vehicles are all accessible in accordance with the Americans with Disabilities Act (ADA) standards.

4.2.2 Bicycle Network

The vision of the City of Clovis *Active Transportation Plan (ATP)*, updated January 2022, is a “city with a complete and connected network of trails, walkways, and bikeways that provides convenient and intuitive connections to key destinations and supports travel within and between neighborhoods. The network improves quality of life by encouraging walking and bicycling for transportation and recreation.” The ATP identifies different strategies to improve safety and accessibility for active modes of transportation such as walking and biking. There are four different types of bicycle facilities in the City:

- Class I (Trails)
- Class II (Bicycle Lanes)
- Class II (Buffered Bicycle Lanes)
- Class III (Bicycle Routes)

One of the long-term visions of the City includes upgrading existing or recommended Class II Bicycle Lanes and Buffered Bicycle Lanes to Class IV Separated Bicycle Lanes.

Figures 4-4 and 4-5 illustrate the existing and proposed bicycle facilities within the City. At present, Class II bicycle lanes exist along Clovis Avenue, Willow Avenue, and some segments of Shepherd Avenue and Fowler Avenue within the study area. However, as shown in Figure 4-5, different bicycle facilities are proposed along other roadways within the study area, such as Sunnyside Avenue, Teague Avenue, Nees Avenue, and Alluvial Avenue.

4.2.3 Pedestrian Network

The City has an extensive pedestrian network, with sidewalks along most of the major roads. However, since a portion of the study area falls within recently incorporated areas of the City, sidewalks are not present because they were previously developed as per unincorporated Fresno County design guidelines. Figure 4-6 illustrates the existing sidewalk facilities within Clovis.

The City's ATP has identified improvements to the pedestrian network based on a citywide sidewalk network gap analysis. Additionally, several potential locations have been identified to install mid-block crossings to improve trail connectivity throughout Clovis. Figure 4-7 illustrates the existing and proposed trails in Clovis and the potential locations of the mid-block trail crossings. As shown on Figure 4-7, two trails (i.e., the Dry Creek Trail and the Enterprise Trail) currently exist within the study area. However, additional trails are being proposed in the study area with potential mid-block crossings.

5.0 TRAFFIC VOLUMES FOR WITHOUT PROJECT SCENARIOS

5.1 EXISTING TRAFFIC VOLUMES

Traffic volumes for existing conditions were developed using existing count data collected by Counts Unlimited at study intersections and roadway segments. Daily tube counts were collected for roadway segments while a.m. and p.m. peak-hour turning movement counts were collected at study intersections. Detailed count sheets are included in Appendix C. It is to be noted that counts at most intersections and roadway segments were collected in May 2022, when schools were in session. However, counts at the intersection of Sunnyside Avenue/Behymer Avenue and the segments of Behymer Avenue between Minnewawa Avenue and Sunnyside Avenue, and between Sunnyside Avenue and Fowler Avenue were collected in June 2022, when schools were not in session. The volumes at these intersections and segments were developed as follows:

- **Intersection of Sunnyside Avenue/Behymer Avenue:** In June 2022, counts were collected both at this intersection and at the adjacent intersection of Minnewawa Avenue/Behymer Avenue. An adjustment factor was applied to the counts at this intersection using the percentage difference between May 2022 and June 2022 traffic counts at the adjacent intersection of Minnewawa Avenue/Behymer Avenue.

- **Segment of Behymer Avenue Between Minnewawa Avenue and Sunnyside Avenue:** In June 2022, counts were collected both at this segment and at the adjacent segment of Behymer Avenue between Willow Avenue and Minnewawa Avenue. An adjustment factor was applied to the counts at this segment using the percentage difference between May 2022 and June 2022 traffic counts at the adjacent segment of Behymer Avenue between Willow Avenue and Minnewawa Avenue.

- **Segment of Behymer Avenue Between Sunnyside Avenue and Fowler Avenue:** In June 2022, counts were collected both at this segment and at the nearby segment of Behymer Avenue between Willow Avenue and Minnewawa Avenue. An adjustment factor was applied to the counts at this segment using the percentage difference between May 2022 and June 2022 traffic counts at the nearby segment of Behymer Avenue between Willow Avenue and Minnewawa Avenue.

Vehicle classification counts were collected at selected study area intersections. Truck percentages for every approach at these intersections were obtained from the classification counts. As for the remaining study intersections without classification counts, truck percentages for the various approaches were obtained based on the truck percentages at the adjacent intersections.

Figure 5-1 illustrates peak-hour traffic volumes at study intersections under existing conditions. Table 5-A shows peak-hour traffic volumes at roadway segments under existing conditions.

5.2 NEAR-TERM (2028) WITHOUT PROJECT TRAFFIC VOLUMES

As approved during the City's scoping agreement process (Appendix A), traffic volumes for near-term conditions were developed by adding trips from cumulative projects in the area to existing traffic volumes.

Information concerning cumulative projects in the vicinity of the proposed project was obtained from City staff and from the adjacent jurisdictions of City of Fresno and County of Fresno. Figure 5-2 illustrates the cumulative project locations.

Trip generations for cumulative projects were either obtained from the respective traffic studies prepared for the projects or developed using trip generation rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition). Table 5-B summarizes the cumulative project trip generation. As shown in Table 5-B, the cumulative projects are expected to generate 9,604 net a.m. peak-hour trips, 13,848 net p.m. peak-hour trips, and 150,662 net daily trips.

Cumulative project trips were assigned to the roadway network based on either the distributions provided in the respective traffic studies for these projects or their locations in relation to surrounding land uses and regional arterials. Figure 5-3 illustrates the peak-hour cumulative project trip assignment at study area intersections. Figure 5-4 illustrates the peak-hour traffic volumes at study intersections under near-term conditions. Table 5-C shows the peak-hour traffic volumes at roadway segments under near-term conditions.

It should be noted that volume development for this scenario have been conducted as an intermediate step for the development of traffic volumes for the Near-Term Plus Project Conditions. As such, as recommended in the City's TIA Guidelines and approved during the scoping agreement process, this scenario has not been analyzed in the LTA.

5.3 CUMULATIVE (2046) WITHOUT PROJECT TRAFFIC VOLUMES

Traffic volumes for cumulative conditions were developed using the Fresno COG ABM. The methodology used to develop cumulative traffic volumes at all study intersections is consistent with the National Cooperative Highway Research Program (NCHRP) and Fresno COG's procedures for post-processing of modeled traffic volumes. Figure 5-5 illustrates the peak-hour traffic volumes at study intersections under cumulative conditions. Table 5-D shows the peak-hour traffic volumes at roadway segments under cumulative conditions.

Detailed volume development worksheets are included in Appendix D.

	23	between Nees Avenue and State Route 168 Westbound Ramps	1,361	60	1,421	1,718	80	1,798

Notes:

[1] Counts at segments 2 and 3 were collected when schools were not in session. Therefore, counts were collected at the adjacent segment 1 at the same time and compared with segment 1 counts prior to school closure. For the a.m. peak hour, segment 1 counts were higher during school session. Therefore, the counts for segments 2 and 3 were adjusted accordingly. However, for the p.m. peak hour, segment 1 counts were lower during school session. Therefore, no adjustment was made to the counts for segments 2 and 3.

[1] Rates from Institute of Transportation Engineers (ITE) Trip Generation Manual , (11th Edition) Land Use 822 - "Strip Retail Plaza (<40k)" , Setting/Location - 'General Urban/Suburban'.

[2] Since pass-by rates from the ITE *Trip Generation Manual* (11th Edition) for Land Use 822 - 'Strip Retail Plaza (<40k)' do not exist. Pass-by rates were taken from Land Use 821 - 'Shopping Plaza (40-150k).' A pass-by rate of 40% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE *Trip Generation Manual* , the p.m. pass-by rate was used as the daily pass-by rate.

[3] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 210 - "Single-Family Detached Housing " , Setting/Location - 'General Urban/Suburban'.

[4] Based on the information obtained from the City, only Phase 1 of the Heritage Grove Specific Plan (between Shepherd to Perrin) is estimated to be completed by 2028. Therefore, trip generation for only Phase 1 of the Heritage Grove have been considered. Trip generation rates from ITE *Trip Generation Manual* , (11th Edition)for various land uses have been used to estimate the trip generation for this project. Trip distribution for this project heve been developed using the Fresno COG ABM select zone model run for these areas.

[5] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 215 - "Single-Family Attached Housing " , Setting/Location - 'General Urban/Suburban'.

[6] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 220 - "Multifamily Housing (Low Rise) Not Close to Rail Transit " , Setting/Location - 'General Urban/Suburban'.

[7] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 820 - "Shopping Center (>150k)" , Setting/Location - 'General Urban/Suburban'.

[8] Pass-by rates from the ITE *Trip Generation Manual* (11th Edition) for Land Use 820 - 'Shopping Center (>150k).' A pass-by rate of 29% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE*Trip Generation Manual* , the p.m. pass-by rate was used as the daily pass-by rate.

[9] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 520 - "Elementary School " , Setting/Location - 'General Urban/Suburban'.

[10] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 821 - "Shopping Plaza (40-150k)- Supermarket - Yes " , Setting/Location - 'General Urban/Suburban'.

[11] Pass-by rates from the ITE *Trip Generation Manual* (11th Edition) for Land Use 821 - 'Shopping Plaza (40-150k)- Supermarket - Yes.' A pass-by rate of 40% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE*Trip Generation Manual* , the p.m. pass-by rate was used as the daily pass-by rate.

[12] Trip generation taken from "Proposed Multifamily Residential Development Tentative Tract No. 6262" traffic study by Peters Engineering Group (May 2019).

[13] Trip generation taken from "Proposed Church" traffic study by Peters Engineering Group (March 2021).

[14] Trip generation taken from "Tract Map 6343" scoping agreement by LSA (July 2022).

[15] Trip generation taken from "Tentative Tract 6050 (Single-Family Housing" traffic study by JLB Traffic Engineering, Inc. (April 2020).

[16] Trip generation taken from "Shepherd Avenue" traffic study by JLB Traffic Engineering, Inc. (June 2018).

[17] Trip generation taken from "TT 6263" traffic study by JLB Traffic Engineering, Inc. (August 2019).

[18] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 150 - "Warehousing" , Setting/Location - 'General Urban/Suburban'.

[19] The truck mix percentages were obtained from South Coast Air Quality Management District (SCAQMD) recommendations for warehousing projects. As such, The truck mix was considered as 6.8% 2-axle trucks, 5.5% 3-axle trucks, and 18.7% 4 or more axle trucks.

[20] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 310 - "Hotel " , Setting/Location - 'General Urban/Suburban'.

[21] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 720 - "Medical-Dental Office Building - Stand Alone" , Setting/Location - 'General Urban/Suburban'.

[22] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 710 - "General Office Building" , Setting/Location - 'General Urban/Suburban'.

[23] Trip generation taken from "Proposed McKenney Assemblage - Tract 6284" traffic study by Peters Engineering Group (March 2020).

[24] Trip generation taken from "Proposed Dry Creek Preserve Master Plan" traffic study by Peters Engineering Group (February 2018).

[25] Trip generation taken from "Master Plan Expansion of the Clovis Community Medical Center" traffic study by JLB Traffic Engineering, Inc. (November 2017).

[26] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 254 - "Assisted Living " , Setting/Location - 'General Urban/Suburban'.

[27] Trip generation taken from "Locan 35" traffic study by JLB Traffic Engineering, Inc. (October 2019).

[28] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 416 - "Campground/Recreational Vehicle Park " , Setting/Location - 'General Urban/Suburban'.

[29] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 945 - "Convenience Store/Gas Station - GFA (2-4K)" , Setting/Location - 'General Urban/Suburban'.

[30] Pass-by rates from the ITE *Trip Generation Manual* (11th Edition) for Land Use 945 - 'Convenience Store/Gas Station - GFA (2-4K).' A pass-by rate of 60% was used for the a.m. peak hour and a pass-by rate of 56% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE *Trip Generation Manual* , the average of a.m and p.m. pass-by rate was used as the daily pass-by rate.

[31] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 933 - "Fast-Food Restaurant without Drive-Through Window" , Setting/Location - 'General Urban/Suburban'.

[32] Since pass-by rates from the *ITE Trip Generation Manual* (11th Edition) for Land Use 933 - 'Fast-Food Restaurant without Drive-Through Window' do not exist. Pass-by rates were taken from Land Use 934 - 'Fast-Food Restaurant with Drive-Through Window.' A pass-by rate of 50% was used for the a.m. peak hour and a pass-by rate of 55% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE *Trip Generation Manual* , the average of a.m and p.m. pass-by rate was used as the daily pass-by rate.

[33] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 934 - "Fast-Food Restaurant with Drive-Through Window" , Setting/Location - 'General Urban/Suburban'.

[34] Pass-by rates from the ITE *Trip Generation Manual* (11th Edition) for Land Use 934 - 'Fast-Food Restaurant with Drive-Through Window.' A pass-by rate of 50% was used for the a.m. peak hour and a pass-by rate of 55% was used for the p.m. peak hour. Since daily pass-by rates are not available for this land use in the ITE *Trip Generation Manual* , the average of a.m and p.m. pass-by rate was used as the daily pass-by rate.

[35] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 151 - "Mini Warehouse" , Setting/Location - 'General Urban/Suburban'.

[36] Rates from ITE *Trip Generation Manual* , (11th Edition), Land Use 948 - "Automated Car Wash" , Setting/Location - 'General Urban/Suburban'.

[37] Trip generation taken from "Tract 6249" traffic study by KD Anderson & Associates, Inc. (June 2019).

6.0 PROJECT TRAFFIC

6.1 PROJECT TRIP GENERATION

The trip generation for the proposed project was developed using rates from the ITE *Trip Generation Manual* (11th Edition) for Land Use 210 – "Single-Family Detached Housing." Table 6-A summarizes the project trip generation. As shown in Table 6-A, the project is anticipated to generate 424 trips in the a.m. peak hour, 569 trips in the p.m. peak hour, and 5,705 daily trips.

6.2 PROJECT TRIP DISTRIBUTION AND ASSIGNMENT

The project trip distribution was developed using select zone model runs obtained from the Fresno COG ABM. Appendix A includes the select zone model plots for the proposed project. Figure 6-1 illustrates the project trip distribution. The project trip generation was applied to the corresponding trip distribution pattern to develop the project trip assignment. Figure 6-2 illustrates the project trip assignment.

7.0 TRAFFIC VOLUMES FOR PLUS PROJECT SCENARIOS

Existing, near-term, and cumulative plus project traffic volumes were developed by adding project traffic to the traffic for the corresponding without project scenarios. Figures 7-1, 7-2 and 7-3 illustrate "plus project" peak-hour traffic volumes at study intersections under existing, near-term, and cumulative conditions, respectively.

Detailed volume development worksheets are included in Appendix D.

8.0 INTERSECTION LEVELS OF SERVICE

8.1 EXISTING LEVELS OF SERVICE

Figure 4-1 illustrates existing study intersection geometrics and traffic control.

8.1.1 Study Intersections

An intersection LOS analysis was conducted for existing conditions using the methodologies previously discussed. Existing Signal timing Sheets were obtained from the City and Caltrans for all signalized analysis intersections. The signal timing sheets are included in Appendix C. It should be noted that the existing signal timings were utilized to analyze traffic operations under near-term and cumulative (2046) scenarios as a conservative approach. Table 8-A summarizes the results of this analysis and shows that the following intersections operate at an unsatisfactory LOS under existing conditions:

- Minnewawa Avenue/Behymer Avenue (a.m. peak hour only)
- Fowler Avenue/Shepherd Avenue (a.m. peak hour only)
- Fowler Avenue/State Route 168 Eastbound Ramps (p.m. peak hour only)

All other study intersections operate at a satisfactory LOS under existing conditions.

8.1.2 Roadway Segments

A roadway segment LOS analysis was conducted for existing conditions using the methodologies previously discussed. Table 8-B summarizes the results of this analysis and shows that all the study roadway segments currently operate at a satisfactory LOS under existing conditions.

8.2 EXISTING PLUS PROJECT LEVELS OF SERVICE

Analysis of the existing with project scenario is provided to identify direct project-related operational deficiency if the project were to be built and in operation today. This scenario eliminates the effects of ambient growth and other cumulative projects and deals specifically with operational deficiencies only due to the project traffic. Figure 4-2 illustrates the study intersection geometrics and traffic control under all ‘plus project’ scenarios.

8.2.1 Study Intersections

An intersection LOS analysis was conducted for existing plus project conditions using the methodologies previously discussed. Table 8-A summarizes the results of this analysis and shows that the following intersection is forecasted to operate at an unsatisfactory LOS under existing plus project conditions:

- Minnewawa Avenue/Behymer Avenue (a.m. peak hour only)
- Sunnyside Avenue/Shepherd Avenue (p.m. peak hour only)
- Sunnyside Avenue/Nees Avenue (p.m. peak hour only)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)

- Fowler Avenue/State Route 168 Eastbound Ramps (p.m. peak hour only)

Based on the operational deficiency criteria stated in Section 3.2 of this TIA, the project is forecasted to create an operational deficiency at these intersections. All other study intersections are forecasted to operate at a satisfactory LOS under existing plus project conditions.

It should be noted that out of the five intersections forecasted to operate at a deficient LOS, three intersections are currently operating at a deficient LOS. As such, the project is forecast to add to the existing deficiencies at these intersections.

8.2.2 Roadway Segments

A roadway segment LOS analysis was conducted for existing plus project conditions using the methodologies previously discussed. Table 8-B summarizes the results of this analysis and shows that all study roadway segments are forecasted to operate at a satisfactory LOS under existing plus project conditions.

8.3 NEAR-TERM (2028) PLUS PROJECT LEVELS OF SERVICE

8.3.1 Study Intersections

An intersection LOS analysis was conducted for near-term plus project conditions using the methodologies previously discussed. Table 8-C summarizes the results of this analysis and shows that the following intersections are forecasted to operate at an unsatisfactory LOS under near-term plus project conditions:

- Minnewawa Avenue/Behymer Avenue (a.m. peak hour only)
- Minnewawa Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Shepherd Avenue (p.m. peak hour only)
- Clovis Avenue/Nees Avenue (p.m. peak hour only)
- Clovis Avenue/Herndon Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/SR-168 Eastbound Ramps (p.m. peak hour only)

Based on the operational deficiency criteria stated in Section 3.2 of this TIA, the project is forecasted to create an operational deficiency at these intersections. All other study intersections are forecasted to operate at a satisfactory LOS under near-term plus project conditions.

8.3.2 Roadway Segments

A roadway segment LOS analysis was conducted for near-term plus project conditions using the methodologies previously discussed. Table 8-D summarizes the results of this analysis and shows that the following roadway segments are forecast to operate at an unsatisfactory LOS under near-term plus project conditions:

- Shepherd Avenue between Willow Avenue and Minnewawa Avenue (p.m. peak hour only)
- Shepherd Avenue between Clovis Avenue and Sunnyside Avenue (p.m. peak hour only)
- Minnewawa Avenue between Behymer Avenue and Shepherd Avenue (a.m. and p.m. peak hours)

All other roadway segments are forecasted to operate at a satisfactory LOS under near-term plus project conditions.

8.4 CUMULATIVE (2046) WITHOUT PROJECT LEVELS OF SERVICE

8.4.1 Study Intersections

An intersection LOS analysis was conducted for cumulative without project conditions using the methodologies previously discussed. Table 8-E summarizes the results of this analysis and shows that the following intersections are forecasted to operate at an unsatisfactory LOS under cumulative without project conditions:

- Willow Avenue/Shepherd Avenue (p.m. peak hour only)
- Minnewawa Avenue/Behymer Avenue (a.m. and p.m. peak hours)
- Minnewawa Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Shepherd Avenue (p.m. peak hour only)
- Clovis Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Herndon Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Teague Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/SR-168 Eastbound Ramps (p.m. peak hour only)

All other study intersections are forecasted to operate at a satisfactory LOS under cumulative (2046) without project conditions.

8.4.2 Roadway Segments

A roadway segment LOS analysis was conducted for cumulative without project conditions using the methodologies previously discussed. Table 8-F summarizes the results of this analysis and shows that the following roadway segments are forecast to operate at an unsatisfactory LOS under cumulative without project conditions:

- Behymer Avenue between Minnewawa Avenue and Sunnyside Avenue (a.m. peak hour only)
- Shepherd Avenue between Willow Avenue and Minnewawa Avenue (p.m. peak hour only)
- Shepherd Avenue between Clovis Avenue and Sunnyside Avenue (p.m. peak hour only)
- Minnewawa Avenue between Behymer Avenue and Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue between Shepherd Avenue and Project Driveway 1 (a.m. and p.m. peak hours)

- Fowler Avenue between Ticonderoga and Shepherd Avenue (a.m. and p.m. peak hours)

All other roadway segments are forecasted to operate at a satisfactory LOS under cumulative without project conditions.

8.5 CUMULATIVE (2046) PLUS PROJECT LEVELS OF SERVICE

8.5.1 Study Intersections

An intersection LOS analysis was conducted for cumulative plus project conditions using the methodologies previously discussed. Table 8-E summarizes the results of this analysis and shows that the following intersection is forecasted to operate at an unsatisfactory LOS under cumulative plus project conditions:

- Willow Avenue/Shepherd Avenue (p.m. peak hour only)
- Minnewawa Avenue/Behymer Avenue (a.m. and p.m. peak hours)
- Minnewawa Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Clovis Avenue/Alluvial Avenue (a.m. peak hour only)
- Clovis Avenue/Herndon Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue/Nees Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Shepherd Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/Teague Avenue (a.m. and p.m. peak hours)
- Fowler Avenue/SR-168 Eastbound Ramps (p.m. peak hour only)
- Sunnyside Avenue/Project Driveway 1 (a.m. and p.m. peak hours)
- Sunnyside Avenue/Project Driveway 2 (a.m. and p.m. peak hours)

Based on the operational deficiency criteria stated in Section 3.2 of this TIA, the project is forecasted to create an operational deficiency at these intersections. All other study intersections are forecasted to operate at a satisfactory LOS under cumulative plus project conditions.

It should be noted that out of the 14 intersections forecast to operate at a deficient LOS, 11 intersections forecast to operate at a deficient LOS under cumulative (2046) without project conditions. As such, the project is forecast to add to the forecasted deficiencies at these 11 intersections.

Detailed intersection LOS worksheets are included in Appendix E.

8.5.2 Roadway Segments

A roadway segment LOS analysis was conducted for cumulative plus project conditions using the methodologies previously discussed. Table 8-F summarizes the results of this analysis and shows that the following roadway segments are forecast to operate at an unsatisfactory LOS under cumulative plus project conditions:

- Behymer Avenue between Minnewawa Avenue and Sunnyside Avenue (a.m. peak hour only)
- Shepherd Avenue between Willow Avenue and Minnewawa Avenue (p.m. peak hour only)
- Shepherd Avenue between Clovis Avenue and Sunnyside Avenue (a.m. and p.m. peak hours)
- Shepherd Avenue between Sunnyside Avenue and Project Driveway 3 (p.m. peak hour only)
- Minnewawa Avenue between Behymer Avenue and Shepherd Avenue (a.m. and p.m. peak hours)
- Sunnyside Avenue between Shepherd Avenue and Project Driveway 1 (a.m. and p.m. peak hours)
- Fowler Avenue between Ticonderoga and Shepherd Avenue (a.m. and p.m. peak hours)

Based on the operational deficiency criteria stated in Section 3.2 of this TIA, the project is forecasted to create an operational deficiency at these roadway segments. All other roadway segments are forecasted to operate at a satisfactory LOS under cumulative plus project conditions.

It should be noted that out of the seven roadway segments forecast to operate at a deficient LOS, six segments are forecast to operate at a deficient LOS under cumulative (2046) without project conditions. As such, the project is forecast to add to the forecasted deficiencies at these six roadway segments.

Notes:

LOS = Level of Service

[1] Classifications for all segments have been obtained from the City of Clovis's General Plan Circulation Diagram, dated December 2014.

[2] Roadway capacities for all segments have been obtained from the Clovis General Plan and Development Code Update Draft PEIR, dated June 2014.

9.0 CIRCULATION IMPROVEMENTS AND FUNDING SOURCES

9.1 RECOMMENDED IMPROVEMENTS

Improvements have been recommended at study intersections and roadway segments where an operational deficiency has been identified based on the results of the LOS analysis. Table 9-A summarizes the recommended improvements for study intersections for all analysis scenarios. Tables 9-B, 9-C, and 9-D summarize the post-improvement intersection LOS under existing, near-term, and cumulative conditions, respectively.

It should be noted that as shown in Tables 8-A, 8-C, and 8-E, the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, as shown in Tables 10-B and 10-C, both the ramp intersections are projected to have queuing deficiencies under future conditions (Near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. As shown in Tables 9-C, and 9-D, the intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under Near-term, and cumulative scenarios with implementation of this improvement. Further, as shown in Tables 10-E and 10-F, and discussed in chapter 10.0 of this report, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Detailed LOS worksheets are included in Appendix E. Figures 9-1, 9-2, and 9-3 illustrate the with recommended improvements intersection geometrics and traffic control under existing, near-term, and cumulative conditions, respectively.

A peak-hour signal warrant analyses have been conducted for the intersections where a signal has been proposed. As such, a signal was only recommended as an improvement if it meets the peak-hour signal warrant. Detailed signal warrant analysis worksheets are included in Appendix F.

Table 9-E summarizes the recommended improvements for roadway segments for all analysis scenarios. Tables 9-F and 9-G summarize the post-improvement roadway segment LOS under near-term and cumulative conditions, respectively.

Improvements identified at intersections and roadway segments adjacent to the project site along Shepherd Avenue and Sunnyside Avenue are illustrated in Figures 9-4, 9-5, and 9-6.

It should be noted that the segment of Fowler Avenue between Ticonderoga and Shepherd Avenue is forecast to operate at a deficient LOS under Cumulative (2046) without and plus project conditions. However, this segment is designated as a Rural collector (2-lanes) in the City's General Plan Circulation Element, and already constructed as per the General Plan Circulation Element designation. Additionally, the project is not estimated to add any traffic at this segment during either peak hours. Therefore, no improvement has been recommended for this roadway segment.

9.2 FUNDING SOURCES AND MECHANISMS

Where there is a funding mechanism (fee program) for the recommended improvements, payment into the fee program would be considered sufficient project obligation to alleviate project-related operational deficiencies. At study locations where the addition of project traffic creates an operational deficiency (existing Plus project conditions) and there is no funding mechanism in place, the project will be responsible for the implementation of the improvement. At locations where the project adds to or creates a forecast deficiency and there is no funding mechanism in place, the project is responsible for its fair-share payment.

9.2.1 Fresno Council of Governments Federal Transportation Improvement Program

The Fresno COG prepares the Federal Transportation Improvement Program (FTIP) in cooperation with its member agencies and transit operators, State and federal agencies, and with public involvement. The FTIP is a compilation of project lists from the State Transportation Improvement Program (STIP), urbanized and non-urbanized areas, and other programs using federal funding. The basic premise behind an FTIP is that it is the incremental implementation (4 years) of the long-range Regional Transportation Plan (RTP) (24 years). The FTIP serves to present to federal funding agencies manageable components of funding the long-range RTP.

9.2.2 City of Clovis Development Impact Fee Program

Several recommended improvements are part of Clovis Development Impact Fee (DIF) Program. As such, since these improvements are included in the City's DIF program, the project will be paying into this fee program for these improvements. The City currently have three mechanisms within its DIF program which will be responsible for these improvements. Following is a summary of these three mechanisms within the City's DIF program:

- **Traffic Signal Fee:** The Traffic Signal fee pays for the construction and financing of those certain planned traffic signals at the intersection of Major Streets and the interconnecting fiber optic system.
- **Outside Travel Lane Fee:** The Outside Travel Lane fee pays for the construction and financing of those certain planned travel lanes of a Major Street that are located between the frontage improvements and the Center Travel Lanes.
- **Center Travel Lane Fee:** The Center Travel Lane fee pays for the construction and financing of those certain planned travel lanes of a Major Street that are located within the median area. The fee also includes the adjacent travel lane on roads with 4 lanes or less, or the 2 adjacent lanes on 6-lane roads.

9.2.3 Project Fair Share

In the absence of a fee program where the project has an impact on the roadway network, the project will pay its respective fair share for the proposed improvements. The project's fair share has been calculated based on project traffic as a percentage of total growth of existing traffic plus project volumes.

Table 9-H summarizes the recommended improvement for the deficient intersections, a funding mechanism, and its fair share percentage. Table 9-I summarizes the corresponding improvements and funding mechanism for the roadway segments.

Notes:

AWSC= All-Way Stop Control; OWSC = One-Way Stop Control; TWSC = Two-Way Stop Control; LOS = Level of Service

Delay = Average control delay in seconds (For OWSC/TWSC intersections, reported delay is for worst-case movement).

* Exceeds LOS Standard
