Segments on Sunnyside Avenue								
16 . between Project Driveway 1 and Shepherd Avenue	Clovis	Convert to 3-Lane TWLTL Collector.	Fair Share				Convert to 3-Lane TWLTL Collector.	10.56%
Segments on Fowler Avenue								
20 . between Ticonderoga and Shepherd Avenue	Clovis	No feasible improvements available since this roadway segment is already built to the City's General Plan Roadway classification standard.	Fair Share				No feasible improvements available since this roadway segment is already built to the City's General Plan Roadway classification standard.	0.00%

Notes:

LOS = Level of Service

[1] Classifications for all segments have been obtained from the City of Clovis's General Plan Circulation Map, dated 2014.

[2] Roadway capacities for all segments have been obtained from the Clovis General Plan and Development Code Update Draft PEIR, dated June 2014.

10.0 INTERSECTION QUEUING ANALYSIS

Tables 10-A, 10-B, and 10-C list the available turn-pocket storage lengths and summarize the 95th percentile back-of-queue lengths at the study intersections under existing, near-term, and cumulative (2046) without project and plus project conditions. The queues for the signalized intersections have been reported from Synchro, while for unsignalized intersections, the SimTraffic queues have been reported since Synchro does not appropriately report queues at unsignalized intersections.

Tables 10-D, 10-E, and 10-F lists the 95th percentile back-of-queue lengths at the study intersections for plus project and plus project with improvements conditions, under existing, near-term (2028), and cumulative (2046) scenarios. It also includes the recommended turn-pocket storage lengths at these intersections. The recommended turn pocket storage lengths have been calculated based on recommended lane geometry with improvements and availability of adequate right-of-way.

It should be noted that as shown in Tables 8-A, 8-C, and 8-E, the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, as shown in Tables 10-B and 10-C, both the ramp intersections are projected to have queuing deficiencies under future conditions (Near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. As shown in Tables 9-C, and 9-D, the intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under Near-term, and cumulative scenarios with implementation of this improvement. Further, as shown in Tables 10-E and 10-F, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Detailed queuing worksheets are included in Appendix G.

	TWSC						

Notes:

ft/ln = feet per lane

EB = Eastbound; WB = Westbound; NB = Northbound; SB = Southbound

L = Left; R = Right

Bold = Queue exceeds available storage.

[1] Storage length for all movements obtained from Google Earth measurements and conceptual site plan.

[2] All queues reported are 95th percentile queues. Queues for signalized intersections have been taken from Synchro and queues for stop controlled intersections have been taken from SimTraffic.

11.0 SITE DISTANCE ANALYSIS AND SAFE ROUTES TO SCHOOL ANALYSIS

As discussed previously and shown on Figure 1-2, access to the project will be provided by four driveways: two on Sunnyside Avenue, one on Perrin Road, and one on Shepherd Avenue. All driveways will operate as full-access driveways.

11.1 SIGHT DISTANCE ANALYSIS

A sight distance analysis was conducted at the project driveways along Sunnyside Avenue, Shepherd Avenue, and Perrin Road. Sight distance is the length of the visible roadway a driver can see approaching vehicles before their line of sight is blocked by any object. For purposes of this analysis, only the stopping sight distance and corner sight distance have been evaluated.

According to the Caltrans *Highway Design Manual* (HDM) (dated July 2020), the stopping sight distance is the minimum sight distance along a roadway required to allow a driver to decrease their speed from the design speed to a complete stop. The corner sight distance is the minimum sight distance in which a driver at a stop-controlled approach can see oncoming traffic on the major street to safely maneuver onto the roadway.

The stopping sight distance was evaluated on the roadways along the project frontage, Including Sunnyside Avenue, Shepherd Avenue, and Perrin Road. The posted speed limit on Shepherd Avenue along the project frontage is 40 miles per hour (mph). For purposes of this analysis, the posted speed limit has been considered as the design speed. There is no posted speed limit on Sunnyside Avenue or Perrin Road, but the north leg of the intersection of Sunnyside Avenue/Shepherd Avenue marks the end of the 45 mph speed zone. Therefore, for purposes of this analysis, the speed limits for both these roadways have been considered to be 40 mph. As stated in Table 201.1 of the HDM, the minimum stopping sight distance is 300 feet for a design speed of 40 mph. Therefore, the minimum stopping sight distance for all project driveways have been considered to be 300 feet.

As for corner sight distance, Section 405.1 of the HDM states that corner sight distance requirements are not applicable for urban driveways unless signalized. At signalized driveways, the minimum corner sight distance was based on design speed, time gap, and type of vehicle for the minor road vehicle to enter the major road. Based on these design speeds and the requirements established in the HDM, it was determined that minimum corner sight distances of the project driveways are as follows:

- **Sunnyside Avenue/Project Driveway 1:** 475 feet
- **Sunnyside Avenue/Project Driveway 2:** 500 feet
- **Project Driveway 3/Shepherd Avenue:** 385 feet
- **Project Driveway 4 – Stanford Avenue/Perrin Road:** 445 feet

As illustrated on Figures 11-1, 11-2, 11-3, and 11-4, the proposed project driveways achieve the adequate sight distances and have clear sight triangles for the drivers.

11.2 SAFE ROUTES TO SCHOOL

The project will be under the jurisdiction of the Clovis Unified School District (CUSD). The CUSD provides transportation for students who live in excess of an established radius zone. The zones are a radius of 1.00 mile for grades Kindergarten through 6th and 2.50 miles for grades 7th through 12th.

Based on the current CUSD maps and school district boundaries, elementary school students residing in the project will be attending the Riverview Elementary School, located at the southeast corner of Chestnut Avenue and Behymer Avenue. The distance between the elementary school and the project is approximately 2.6 miles. As such, the project is not within the school's walking radius area. As such, CUSD will provide transportation for the elementary school students. Additionally, some elementary school students from the project will be accessing the elementary school by cars. Therefore, no safety improvements may be required for the elementary school students.

It should be noted that the project is within the vicinity of the proposed Heritage Grove Specific Plan project. Based on the project description of the Specific Plan, an elementary school is being proposed within Planning Area 9 of the Specific Plan. Though the completion date for this elementary school is still undetermined, elementary school students from the project are anticipated to attend this school once completed. This new school will be within close proximity of the project site. The Heritage Grove Specific Plan project will also be constructing sidewalks and bike lanes as part of internal circulation network to provide safe route for walking and biking to school. As such, no further safety improvements may be required for the elementary school students upon construction of this elementary school.

The project is currently within the district boundaries of Granite Ridge Intermediate School, and Clovis North High School. Both these schools are located at the northwest corner of the intersection of Willow Avenue/International Avenue. The distance between these schools and the project is approximately 3.8 miles. As such, CUSD will provide transportation for the intermediate and high school student from the project. Because of the distance, it is not anticipated that students residing within the project will be walking/biking to the intermediate or high school.

As such, no further safety improvements will be required for accessing the elementary, intermediate or high school from the project site.

12.0 CALTRANS FREEWAY QUEUING ANALYSIS

As recommended by the Caltrans staff during the scoping agreement process, a freeway queuing analysis has been conducted at all Caltrans facilities at which project traffic gets added. Since the project is estimated to add traffic at the Herndon Avenue and Fowler Avenue interchanges, a freeway queuing analysis was performed at the off-ramps at these interchanges.

12.1 FREEWAY QUEUING ANALYSIS

A freeway queuing analysis was performed to examine safety impacts at the Herndon Avenue and Fowler Avenue interchange off-ramps. The queuing analysis will review the speed differential between the off-ramp queue and mainline traffic during the peak hours. If the speed differential exceeds the significance thresholds as outlined in the *Safety Review Practitioners Guidance* (30 mph), traffic safety improvements will need to be identified to offset operational deficiencies on traffic safety, if any.

Table 12-A summarizes the off-ramp speed differential between the SR-168 mainline and the off-ramps at the Herndon Avenue and Fowler Avenue interchanges. The ramp and mainline speeds were calculated using the Highway Capacity Software (i.e., HCS 7). As summarized in Table 12-A, the speed differential between the freeway mainlines and off-ramps for both interchanges are less than 30 mph with the exception of the diverge segment at the SR-168 westbound Herndon Avenue Off-Ramp. As such, no safety improvements may be necessary at all other locations.

The diverge segment at the SR-168 westbound Herndon Avenue Off-Ramp is forecast to operate at an unsatisfactory condition (LOS F) during p.m. peak hours under existing, near-term (2026) and cumulative (2046) conditions. Therefore, HCS 7 results may be unreliable for that diverge segment. However, since the segment is performing at LOS F, it could be estimated that the facility is being heavily congested, and a speed differential between the off-ramp queue and mainline traffic would potentially be much lower than the Caltrans significance threshold of 30 mph. However, improvements would be required at this off-ramp location to improve traffic operations in the freeway mainline. Since the project has no direct control of implementing improvements at a Caltrans facility, the deficiency at this location would remain significant and unavoidable.

It should be noted that as shown in Tables 8-A, 8-C, and 8-E, the intersections of SR- 168 Westbound Ramps/Herndon Avenue, and SR- 168 Eastbound Ramps/Herndon Avenue are forecast to operate at a satisfactory LOS under all scenarios. However, as shown in Tables 10-B and 10-C, both the ramp intersections are projected to have queuing deficiencies under future conditions (Near-term and cumulative scenarios). Additionally, the adjacent intersection of Clovis Avenue/Herndon Avenue is forecast to operate at an unsatisfactory LOS under Near-term, and cumulative scenarios, which may further deteriorate the ramp performance due to proximity of this intersection to the freeway ramps. Therefore, an evaluation of these intersections using signal timing coordination and optimization was performed under near-term and cumulative scenario. As shown in Tables 9-C, and 9-D, the intersection of Clovis Avenue/Herndon Avenue is forecast to operate at a satisfactory LOS along with the ramp intersections under Near-term, and cumulative scenarios with implementation of this improvement. Further, as shown in Tables 10-E and 10-F, and discussed in chapter 10.0 of this report, this also helps eliminate the queuing issues at the ramp intersections along with additional storage length improvement proposed to the SR- 168 Westbound Ramps at Herndon Avenue.

Detailed HCS worksheets are included in Appendix H.

-- indicates deficient LOS due to high congestion.

13.0 SUMMARY AND CONCLUSIONS

The proposed project will consist of 605 single-family homes on approximately 77 acres of the site. The remaining 78 acres of the site will be used for roads, utilities, greenspace, landscaping, and pedestrian paths. It is anticipated that the project buildout will occur in year 2028. Access to the project will be provided by four full-access driveways: two on Sunnyside Avenue, one on Perrin Road, and one on Shepherd Avenue.

13.1 VEHICLE MILES TRAVELED ANALYSIS SUMMARY

The project VMT per capita is 20.7 percent higher than the City's VMT per capita threshold. Therefore, based on the TIA Guidelines, the project will have a significant VMT impact. The project will implement applicable mitigation measures in consultation with the City staff. . It is estimated that the project could achieve approximately 1.18 percent VMT reduction from various mitigation measures.

13.2 EXISTING CONDITIONS SUMMARY

All study intersections and roadway segments operate at a satisfactory LOS under existing without and with project conditions with the exception of 5 intersections.

13.3 NEAR-TERM (2028) CONDITIONS SUMMARY

All intersections and roadway segments are forecast to operate at a satisfactory LOS under near-term (2028) plus project conditions with the exception of 10 intersections and 3 roadway segments.

13.4 CUMULATIVE (2046) CONDITIONS SUMMARY

All intersections and roadway segments are forecast to operate at a satisfactory LOS under cumulative (2046) plus project conditions with the exception of 14 intersections and 7 roadway segments.

13.5 IMPROVEMENTS SUMMARY

Based on the improvements discussed in Section 9.1, Recommended Improvements, of this report, all intersections and all but one roadway segment are estimated to operate satisfactorily. Some of the recommended circulation improvements are covered by the Fresno COG FTIP and the City's Community Investment Program. For the remaining improvements, some improvements along the project frontage will be direct project responsibility. The project will pay fair share percentages for the remaining improvements.

13.6 QUEUEING ANALYSIS SUMMARY

The recommended storage lengths have been proposed at intersections based on the availability of right-of-way and 95th percentile back-of-queue lengths at the study intersections. Additionally, a signal timing coordination and optimization has been proposed at the SR-168 Ramps and the adjacent intersection to alleviate LOS and queuing issues at this location.

13.7 SIGHT DISTANCE ANALYSIS SUMMARY

A sight distance analysis was conducted at the project driveways. Based on the sight distance analysis, the proposed project driveways achieve adequate sight distances and have clear sight triangles for the drivers.

13.8 SAFE ROUTES TO SCHOOL ANALYSIS SUMMARY

The project is approximately 2.0 miles from the elementary school and it is estimated that CUSD will provide for student transportation for elementary school students. The project is within the boundary of Granite Ridge Intermediate School and Clovis North High School. The CUSD is estimated to arrange for transport to the intermediate and high school due to the distance.

13.9 FREEWAY QUEUING ANALYSIS SUMMARY

The speed differential between the off-ramp and the mainline is less than 30 mph for all scenarios except for the diverge segment for the off-ramp at the Herndon Avenue Interchange Since the project has no direct control of implementing improvements at a Caltrans facility, the deficiency at this location would remain significant and unavoidable.

Subject: Scope of Work for the Shepherd North Project Transportation Impact Analysis (LSA Project No. DNV2201)

Dear Sean:

LSA will be preparing a Transportation Impact Analysis (TIA) for the Shepherd North Project (project) in the City of Clovis (City) in Fresno County (County). The 155-acre project site is located at the northeast corner of intersection of Sunnyside Avenue and Shepherd Avenue. The project site is currently vacant. Figure 1 (all figures, tables, and appendices attached) illustrates the regional and project location.

The project will be a residential development including 605 single-family homes of approximately 77-acre of the site. It should be noted that remaining 78-acre of the site will be used for roads, utilities, greenspace, landscaping, and pedestrian paths. Figure 2 illustrates the tentative subdivision map for the project. Access to the project site will be provided via four driveways – two on Sunnyside Avenue, one on Perrin Road, and one on Shepherd Avenue. For purposes of this analysis, all driveways have been considered as full-access driveways.

LSA anticipates that the following scope of work will be required to prepare the TIA for the proposed project.

SCOPE OF WORK

LEVEL OF SERVICE ANALYSIS

Study Area Intersections

While Level of Service (LOS) analysis is no longer a determinant of California Environmental Quality Act (CEQA) impacts, consistency with the City's General Plan goals and policies is still required. Therefore, a Local Transportation Analysis (LTA) will be prepared to satisfy the requirements established by the City of Clovis *Interim Transportation Impact Analysis Guidelines* (TIA Guidelines), dated July 14, 2020, and requirements established by the California Department of Transportation (Caltrans). As such, traffic operations at all study intersections will be analyzed during the weekday a.m. and p.m. peak hours. The a.m. peak hour is defined as the one hour period of the highest traffic volume occurring between 7:00 and 9:00 a.m. while the p.m. peak hour is defined as the one hour period of the highest traffic volume occurring between 4:00 and 6:00 p.m. Intersection LOS will be calculated using the *Highway Capacity* Manual 6th Edition (HCM 6) analysis methodologies and by using the Synchro 11 software.

As per the City's TIA guidelines, the extent of the study area should include the following:

- Pedestrian, bicycle, and transit facilities within a half-mile distance from the project site boundary;
- All intersections of major streets that would provide direct access to the project;
- All signalized intersections within one-half mile of the project site boundary where the project would add 50 or more peak hour trips, and signalized intersections beyond one-half mile where the project would add 100 or more peak hour trips; and
- All unsignalized intersections within a half-mile of the project site boundary where the project would add more than 50 peak hour trips.

As such, the TIA will examine the following intersections:

1. Willow Avenue/Behymer Avenue (City of Clovis/City of Fresno);
2. Willow Avenue/Shepherd Avenue (City of Clovis/City of Fresno);
3. Minnewawa Avenue/Behymer Avenue (City of Clovis);
4. Minnewawa Avenue/Shepherd Avenue (City of Clovis);
5. Clovis Avenue/Shepherd Avenue (City of Clovis);
6. Clovis Avenue/Teague Avenue (City of Clovis);
7. Clovis Avenue/Nees Avenue (City of Clovis);
8. Clovis Avenue/Alluvial Avenue (City of Clovis);
9. State Route 168 (SR-168) Westbound Ramps/Herndon Avenue (Caltrans);
10. SR-168 Eastbound Ramps/Herndon Avenue (Caltrans);
11. Clovis Avenue/Herndon Avenue (City of Clovis);
12. Sunnyside Avenue/Behymer Avenue (City of Clovis);
13. Sunnyside Avenue/Shepherd Avenue (City of Clovis);
14. Sunnyside Avenue/Teague Avenue (City of Clovis);
15. Sunnyside Avenue/Nees Avenue (City of Clovis);
16. Fowler Avenue/Behymer Avenue (City of Clovis);
17. Fowler Avenue/Ticonderoga (City of Clovis);
18. Fowler Avenue/Shepherd Avenue (City of Clovis);
19. Fowler Avenue/Teague Avenue (City of Clovis);

20. Fowler Avenue/Nees Avenue (City of Clovis);
21. Fowler Avenue/SR-168 Westbound Ramps (Caltrans);
22. Fowler Avenue/SR-168 Eastbound Ramps (Caltrans);
23. Sunnyside Avenue/Project Driveway 1 (City of Clovis);
24. Sunnyside Avenue/Project Driveway 2 (City of Clovis);
25. Project Driveway 3/Shepherd Avenue (City of Clovis); and
26. Project Driveway 4-Stanford Avenue/Perrin Road (City of Clovis).

Figure 3 illustrates the study area intersections.

Roadway Segments

In addition to the study area intersections, the TIA will examine traffic operations at the following roadway segments:

1. Behymer Avenue, between Willow Avenue and Minnewawa Avenue (City of Clovis);
2. Behymer Avenue, between Minnewawa Avenue and Sunnyside Avenue (City of Clovis);
3. Behymer Avenue, between Sunnyside Avenue and Fowler Avenue (City of Clovis);
4. Shepherd Avenue, between Willow Avenue and Minnewawa Avenue (City of Clovis);
5. Shepherd Avenue, between Minnewawa Avenue and Clovis Avenue (City of Clovis);
6. Shepherd Avenue, between Clovis Avenue and Sunnyside Avenue (City of Clovis);
7. Shepherd Avenue, between Sunnyside Avenue and Project Driveway 3 (City of Clovis);
8. Shepherd Avenue, between Project Driveway 3 and Fowler Avenue (City of Clovis);
9. Herndon Avenue, between State Route 168 Eastbound Ramps and Clovis Avenue (City of Clovis);
10. Willow Avenue, between Behymer Avenue and Shepherd Avenue (City of Clovis/City of Fresno);
11. Minnewawa Avenue, between Behymer Avenue and Shepherd Avenue (City of Clovis);
12. Clovis Avenue, between Shepherd Avenue and Teague Avenue (City of Clovis);
13. Clovis Avenue, between Teague Avenue and Nees Avenue (City of Clovis);
14. Clovis Avenue, between Nees Avenue and Alluvial Avenue (City of Clovis);
15. Clovis Avenue, between Alluvial Avenue and Herndon Avenue (City of Clovis);
16. Sunnyside Avenue, between Project Driveway 1 and Shepherd Avenue (City of Clovis);
17. Sunnyside Avenue, between Shepherd Avenue and Teague Avenue (City of Clovis);

18. Sunnyside Avenue, between Teague Avenue and Nees Avenue (City of Clovis);
19. Fowler Avenue, between Behymer Avenue and Ticonderoga (City of Clovis);
20. Fowler Avenue, between Ticonderoga and Shepherd Avenue (City of Clovis);
21. Fowler Avenue, between Shepherd Avenue and Teague Avenue (City of Clovis);
22. Fowler Avenue, between Teague Avenue and Nees Avenue (City of Clovis); and
23. Fowler Avenue, between Nees Avenue and State Route 168 Westbound Ramps (City of Clovis).

As recommended in the City's TIA guidelines, daily traffic operations at roadway segments will be analyzed based on the peak hour level of service volume thresholds obtained from Chapter 5.16, *Transportation and Traffic,* of the City's *General Plan and Development Code Update Draft Program Environmental Impact Report,* dated June 2014.

Project Trip Generation, Trip Distribution, and Trip Assignment

The trip generation for the proposed project was developed using rates from the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition) for Land Uses 210 - "Single-Family Detached Housing." The project trip generation is summarized in Table A. The project is anticipated to generate 5,705 total daily trips, with 424 trips occurring during the a.m. peak hour and 569 trips occurring during the p.m. peak hour.

The project trip distribution patterns were derived from the select zone model runs obtained from the Fresno Council of Governments' (COG's) Activity-Based Model (ABM). The select zone model plot is included in Appendix A. Figure 4 illustrates the project trip distribution. The project trip assignment at the study intersections is the product of the project trip generation and the corresponding trip distribution percentages. Figure 5 illustrates the project trip assignment at the suggested study area of intersections.

Analysis Scenarios

The TIA will be prepared based on consultation with City staff and Caltrans to meet the requirements of both the City and Caltrans. The TIA will examine traffic operations at the study area intersections and roadway segments under the following scenarios:

- Existing Conditions;
- Existing Plus Project Conditions;
- Near-Term Plus Project Conditions;
- Cumulative Year without Project Conditions; and
- Cumulative Year Plus Project Conditions.

Volume Development and Analysis Methodology

Traffic volumes for existing conditions are typically developed using existing count data collected at study area intersections and roadway segments. Despite the ongoing COVID-19 pandemic, LSA anticipates that at present, traffic is operating near or at pre-pandemic levels, and therefore, adjustments to traffic counts will not be required. However, in case City staff requires adjustments to existing traffic counts, appropriate adjustments will be made by obtaining historical counts at study area intersections and segments.

Traffic volumes under near-term plus project conditions will be developed by adding traffic volumes from approved and pending projects located near the study area and project traffic to existing traffic volumes. LSA will contact City staff and adjacent jurisdictions for a list of cumulative projects.

Traffic volumes for cumulative year without project conditions will be developed by using forecast volumes obtained from the Fresno COG ABM. The methodology to develop cumulative year without project traffic volumes at study area intersections and roadway segments will be consistent with the COG's procedures for post-processing of modeled traffic volumes. The resulting intersection and roadway segment LOS will be calculated using the previously discussed methodologies.

Existing and cumulative year plus project traffic volumes will be developed by adding project traffic to the traffic volumes for the corresponding without project scenarios.

Intersection Queuing Analysis

An intersection queuing analysis will be performed at all study intersections. The queuing analysis will be performed using Synchro for signalized intersections and using SimTraffic for unsignalized intersections.

Caltrans Ramp Queuing Analysis

As requested by Caltrans staff, a ramp queuing analysis will be performed at the SR-168/Herndon Avenue and SR-168/Fowler Avenue interchanges to identify potential traffic safety impacts. The evaluation of safety impacts will include a review for speed differential between the exit ramps queue and the mainline of SR-168 during the same peak hour study period. The analysis will be performed as per the Caltrans *Interim Land Development and Intergovernmental Review (LDIGR) Safety Review Practitioners Guidance*, dated July 2020.

Site Access and Circulation Analysis

A site access and circulation analysis will be conducted as per the criteria stated in the City's TIA guidelines. The following issues will be evaluated as part of this analysis:

- Anticipated queues and minimum required throat depth (MRTD) at all project access locations;
- A sight distance analysis at the project driveways including recommended improvements in cases of unsafe traffic conditions; and
- Safety of potential pedestrian paths of travels from the project site to schools, commercial areas, and nearby bus stops.

Analysis of Traffic Operations and Recommended Circulation Improvements

Levels of service without the project will be compared with levels of service plus the project for all analysis scenarios to determine operational deficiencies based on the LOS standards and operational deficiency criteria as applicable for the City and Caltrans. Furthermore, necessary improvements will be recommended to offset any operational deficiencies. Improvements may include addition of intersection turn lanes, segment lane additions, signalization, etc. The LOS with the proposed improvements will be calculated and summarized, along with a comparison of the LOS without improvements.

Signal Warrant Analysis (if Required)

A signal warrant analysis would be conducted at unsignalized intersections if a signal is recommended as an improvement. Peak hour approach volumes for study intersections will be examined to determine whether signalization may be warranted per the criteria defined in the California supplement of the *Manual on Uniform Traffic Control Devices* (CA-MUTCD).

Fair-Share Contributions (if Required)

A fair share percentage will be calculated for study area intersection and roadway segment improvements recommended in the TIA that are not included in the Measure C program, the City's Development Fee program or any other funding program. The percentage of fair share for the project will be calculated at each location using the total trips generated by the project divided by the total "new" traffic, which is the net increase in traffic volumes from existing to cumulative year conditions.

PROJECT VEHICLE MILES TRAVELED ANALYSIS

The TIA will include a Vehicle Miles Traveled (VMT) analysis to meet CEQA requirements. The project VMT analysis will be prepared consistent with the City's TIA Guidelines. As per the City's TIA Guidelines, the project cannot be considered as a small project given that the project exceeds 53 dwelling units. Therefore, a full VMT analysis will be required for the project. For purposes of this analysis, the project-generated VMT per capita will be obtained from the Fresno COG ABM. As per the City's TIA Guidelines, a significant project-generated VMT impact would occur if the project's VMT per capita exceeds a level of 13 percent below the existing County average VMT per capita provided in the guidelines. In case of a significant VMT impact, appropriate mitigation measures will be recommended based on discussion with City staff.

Should you have any questions, please do not hesitate to contact me at (951) 781-9310 or email me at Ambarish.Mukherjee@lsa.net.

COMMENTS:

TIMING UPDATES AND MODIFICATIONS

ID: 283 **NAME:** Shepherd & Willow

DATE	CHANGES MADE	ATMS or CABINET	BY
2/22/2020	Made minor changes to timing calculations and updated detector attributes. Set intersection back to 8 phase operation from Split		
	Phase operations due to construction.

COMMENTS:

There is a DLC for WB Right-turn lane detection. However, there are no more slots to land this DLC in the 332A Cabinet. Label DLC and Place in bottom of Cabinet. Future use at 4I7L which is currently used for the Bike Lane Detection.

CLOVIS & TEAGUE

Controller Intervals

0 = Walk	8 = Red Rest
1 = FDW	9 = Preemption
2 = Min. Green	A = Stop Time
3 =	B = Red Revert
4 = Var. Initial	C = Yellow - Gap Termination
5 = Extension	D = Yellow - Max. Termination
6 =	E = Yellow - Forceoff Termination
7 = Reduce Gap	F = Red Clearance

Interval Timer Display

Ring A = F/0 + A + Interval Row
Ring B = F/0 + B + Interval Row
(Interval Row From PHASE BANK Data)

412/C Memory Module Lithium Battery Condition

To check the condition of the 3.6 volt Lithium Battery on the 412/C Memory Module :

If E/112 + 0 + A = 84 - the battery is BAD
If E/112 + 0 + A = 85 - the battery is O.K.

Monitor "Activate" Flags

(Also Requires T.O.D. Function "E" Flag)

Detector Count Recording :
E/2 + 0 + 9 = Not Zero
Real Time Split Monitor :
E/2 + 0 + E = Not Zero

Special Event Schedules

Special Event #1 : C + 0 + E = 27
Special Event #2 : C + 0 + E = 28

Current Interval = E + 5 + 0
Current Interval Timer = E + 5 + B
Current Interval Clearance Phases = E + 5 + C

Time of Day Function (7 Key)

Current T.O.D. "E Function" Control Bits = C/0 + E + E
Current T.O.D. "F Function" Output Bits = C/0 + E + F

Logic DELAY Gate Delay Timer Display

DELAY A Timer = C/0 + 9 + A
DELAY B Timer = C/0 + 9 + B
thru thru
DELAY F Timer = C/0 + 9 + F

Power & Flash Recording

Last Power Failure :
(HR-MIN-DOW) = 8 + 4
(DOM-YR-MONTH) = 8 + 5
Last Cabinet Flash :
(HR-MIN-DOW) = 8 + 6
(DOM-YR-MONTH) = 8 + 7
Power Fail Counts :
(Long Failures) = F/1 + 0 + C
(Short Failures) = F/1 + 0 + D
Current Time :
(HR-MIN-DOW) = 8 + 0
(DOM-YR-MONTH) = 8 + 1
(MIN-SEC-1/10 SEC) = 8 + F

Display Locations

	Plan Select	Offset Select
Manual	= C/0 + A + 1	C/0 + B

B	11 th DIGIT	
C	12 th DIGIT	
D	13 th DIGIT	
E	14 th DIGIT	
F	15 th DIGIT	

< C + 0 + C = 5 >

DIAL-UP ("stand alone") Modem Interface

Set C/5+D+0 (NUMBER OF DIGITS) to a "Non-Zero" value. This will disable parity for "Smart Modem" operation.

NOTE : DO NOT set to a "Non-Zero" value without also programming a number to dial.

REDIAL TIME

(C/5 + C + 0) = 10 Minutes

NOTE: The Redial Timer is at location E/2+D+6

DISABLE ALARM REPORTING

		Column F 1	2	3	4	5	6	7	8
0	OMIT ALARMS								

< C + 0 + C = 5 >

1 = Stop Time	5 = Police Control
2 = Flash Sense	6 = External Alarm
3 = Keyboard Entry	7 = Detector Failure
4 = Manual Plan	8 =

Default is: Report All Alarms (No Flags Set)

PROGRAMMABLE DAYLIGHT SAVINGS IMPLEMENTATION

		Column 2
A	Begin MONTH	4
B	Begin WEEK	1
C	End MONTH	10
D	End WEEK	5

< C + 0 + C = 5 >

If WEEK = 5, use last week of month. If WEEK and MONTH are set to Zero, use "default" data.

PREEMPT PRIORITY

		Column C
0	EV A	
1	EV B	
2	EV C	
3	EV D	
4	RR 1	▨
5	RR 2	▨
6	SE 1	
7	SE 2	

< C + 0 + E = 125 >

Highest value has highest priority. If all are set to Zero, use "default" priority.

DISABLE LOW PRIORITY :

	1	2	3	4	5	6	7	8
(E/125 + C + 8) =								

1 = Low Priority A	5 = Not Used
2 = Low Priority B	6 = Not Used
3 = Low Priority C	7 = Not Used
4 = Low Priority D	8 = Not Used

MINIMUM GREEN FOR PREEMPT FORCE-OFF :

(F/1 + 0 + 8) = 4 Seconds

MAXIMUM PREEMPT TIME :

(F/1 + 0 + 9) = 255 Minutes

For Emergency Vehicle and RR-2 Limited Service.
(Output at E/127+A+0)
Note: Set to 255 to Disable

SAME CHANNEL PREEMPT LOCKOUT TIME :

(F/1 + 0 + A) = 0 Seconds

Does not apply to Railroad Preempt

UPS

"INITIALIZED" INPUT FILE ASSIGNMENTS --- STANDARD 332 CABINET
< "C-1" Harness Type # 1 >

DETECTOR TYPES

Ext = Extension Detector
Detector is only active during the Phase's GREEN intervals (ie, will NOT Call the Phase)

Cnt = Count Detector
Used in computing "Added Initial"

Call = Calling Detector
Detector is only active during the Phase's NON-GREEN interval (ie, will NOT Extend the Phase)

Type 3 = Type 3 Disconnect
Will allow a Calling Detector to Extend its Phase until the C first drops or the "Type 3 Limit" is reached

Notes:

0 <E/28+5+F>

Limited Service Interval

AGENDA ITEM NO. 6.

Min Time (seconds) | 4 | <F/1+0+8>

Min Green Before PE Force Off

Max Time (minutes) | 1 | <F/1+0+9>

Max Preempt Time Before Failure

Min Time (seconds) | 0 | <F/1+0+A>

Min Time Between Same Preempts

(Does Not Apply To Railroad Preempt)

Low Pri. Channel | ______ | <E/125+C+8>

Disable Low Priority Channel

Low Priority
1 = Channel A
2 = Channel B
3 = Channel C
4 = Channel D

Delay Time (seconds) | 0 | <F/1+A+D>

Bus Delay

Max Time (seconds) | 0 | <F/1+A+E>

Max Early Green

Max Time (seconds) | 0 | <F/1+A+F>

Max Green Extension

Row	Time	Headway	Direction	Day of Week

PREEMPTION NOTE: Each preemption has it's own set of menus. To access each menu :

a. Press "3" for preemption

b. Then enter "Preempt number" (1 through 6 and shown as "#" in Schedules above)

c. Then enter "number of Menu item" you want to access (*1-Times, 2-Phases, 3-Options, 4-Times+, 5-Overlaps+ or 6-Options+*)

d. Once in an above menu push Escape once to go back to main preempton menu.

Ring B = F/0 + B + Interval Row
(Interval Row From PHASE BANK Data)

412/C Memory Module Lithium Battery Condition

To check the condition of the 3.6 volt Lithium Battery on the 412/C Memory Module :

If E/112 + 0 + A = 84 - the battery is BAD
If E/112 + 0 + A = 85 - the battery is O.K.

Monitor "Activate" Flags

(Also Requires T.O.D. Function "E" Flag)

Detector Count Recording :
E/2 + 0 + 9 = Not Zero
Real Time Split Monitor :
E/2 + 0 + E = Not Zero

Special Event Schedules

Special Event #1 : C + 0 + E = 27
Special Event #2 : C + 0 + E = 28

Current Interval = E + 5 + 0
Current Interval Timer = E + 5 + B
Current Interval Clearance Phases = E + 5 + C

Time of Day Function (7 Key)

Current T.O.D. "E Function" Control Bits = C/0 + E + E
Current T.O.D. "F Function" Output Bits = C/0 + E + F

Logic DELAY Gate Delay Timer Display

DELAY A Timer = C/0 + 9 + A
DELAY B Timer = C/0 + 9 + B
thru thru
DELAY F Timer = C/0 + 9 + F

Power & Flash Recording

Last Power Failure :
(HR-MIN-DOW) = 8 + 4
(DOM-YR-MONTH) = 8 + 5
Last Cabinet Flash :
(HR-MIN-DOW) = 8 + 6
(DOM-YR-MONTH) = 8 + 7
Power Fail Counts :
(Long Failures) = F/1 + 0 + C
(Short Failures) = F/1 + 0 + D
Current Time :
(HR-MIN-DOW) = 8 + 0
(DOM-YR-MONTH) = 8 + 1
(MIN-SEC-1/10 SEC) = 8 + F

DETECTOR TYPES

Ext - Extension Detector
Detector is only active during the Phase's GREEN intervals
(ie, will NOT Call the Phase)
Cnt - Count Detector
Used in computing "Added Initial"
Call - Calling Detector
Detector is only active during the Phase's NON-GREEN intervals
(ie, will NOT Extend the Phase)
Type 3 - Type 3 Disconnect
Will allow a Calling Detector to Extend its Phase until the Call first drops or the "Type 3 Limit" is reached
